

Group Policies

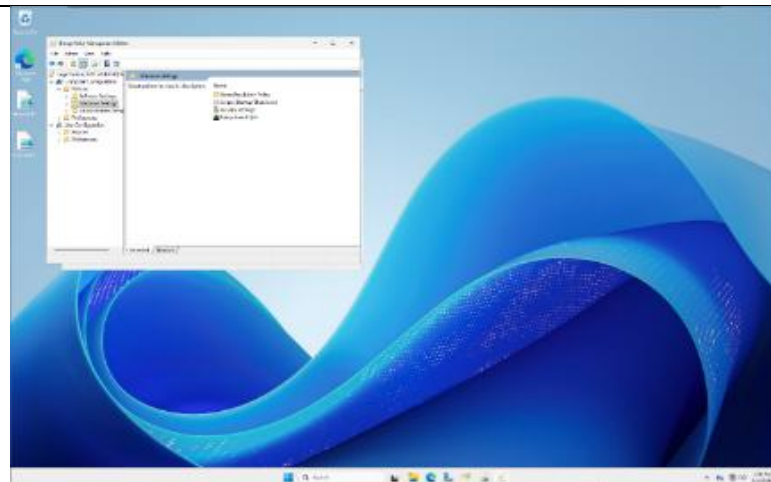

- Boot up server and workstation in VmWare.

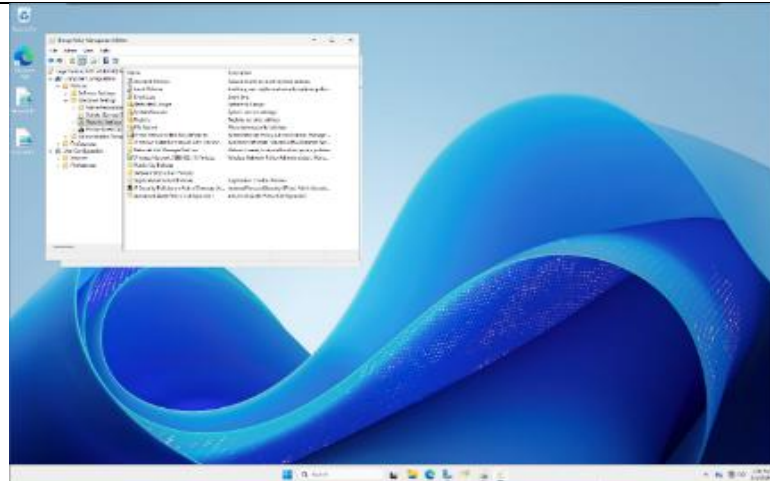

- In the server open up Group Policy Management, right click on the domain and create a new GPO named Legal Notice.

- Under Computer Configuration select Windows Settings.

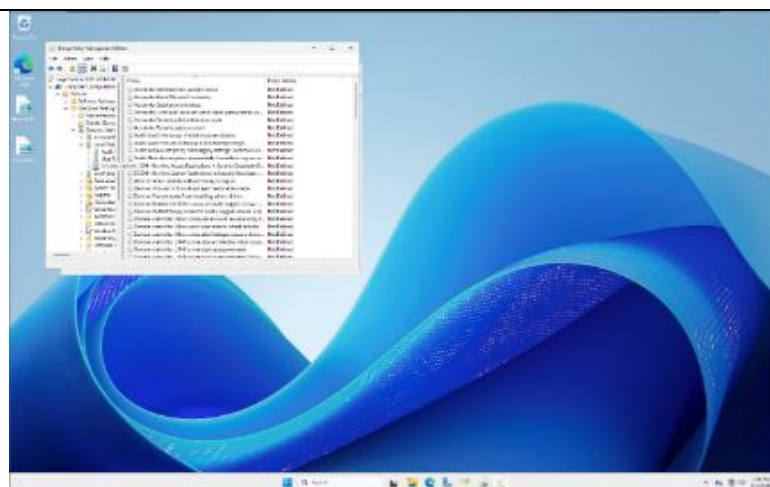

- Under Windows Settings select Security Settings.

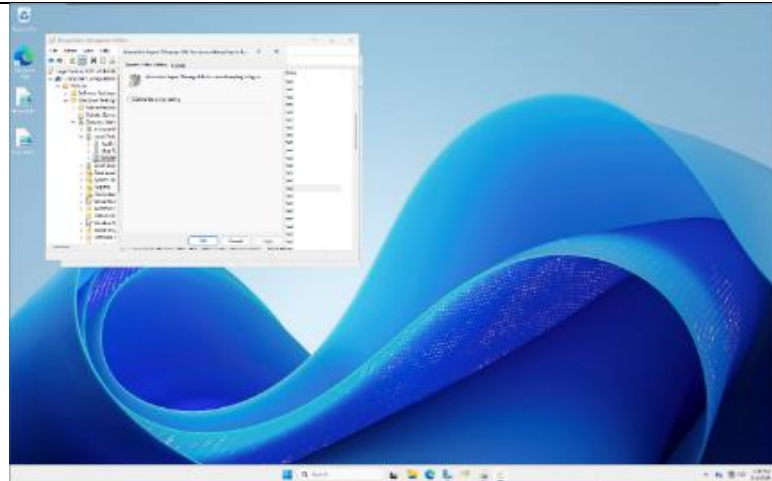

- Under Security Settings select Local Policies.

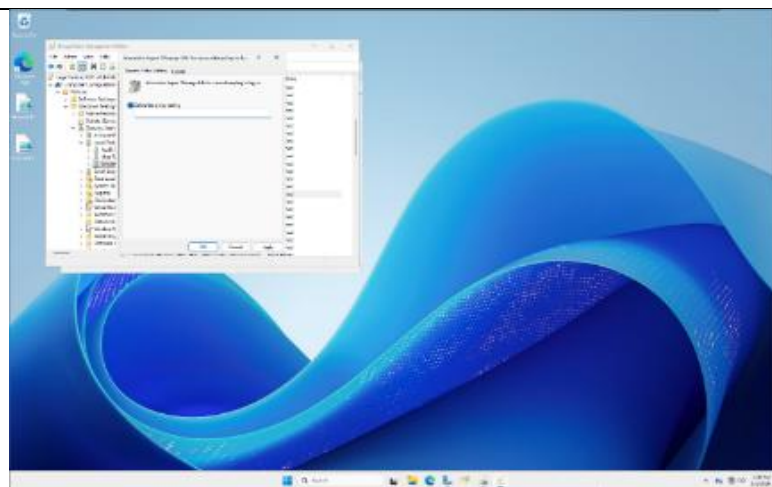

- Under Local Policies find Security Options

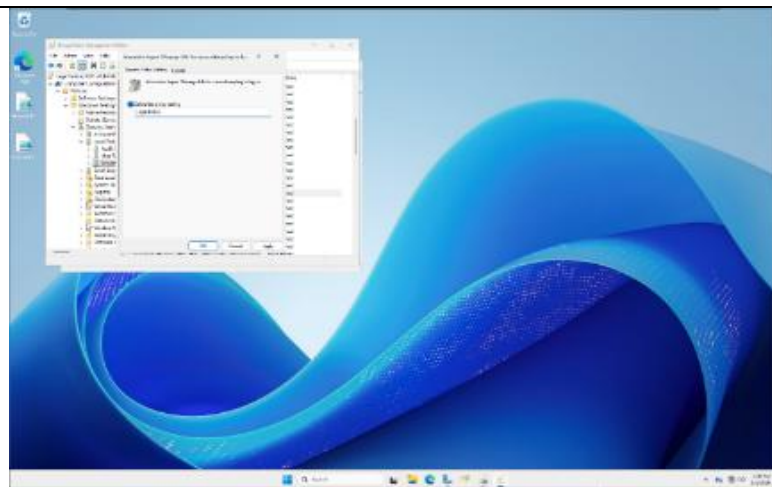

- Find the policy Interactive Logon Message Title.

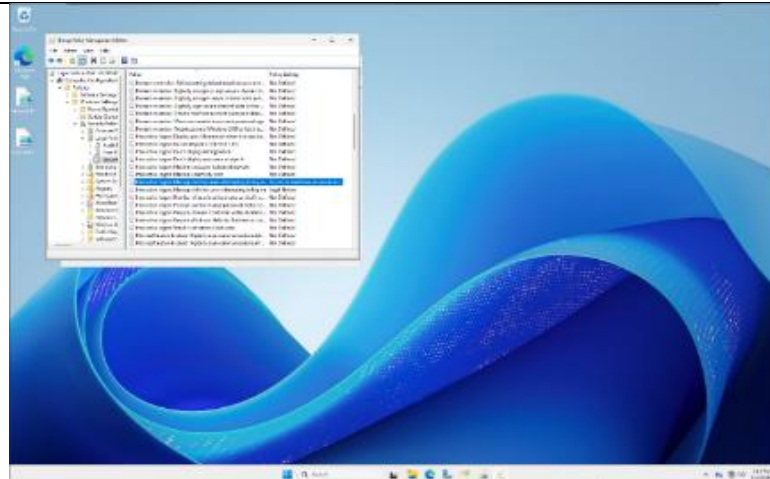

- Click define this policy setting.

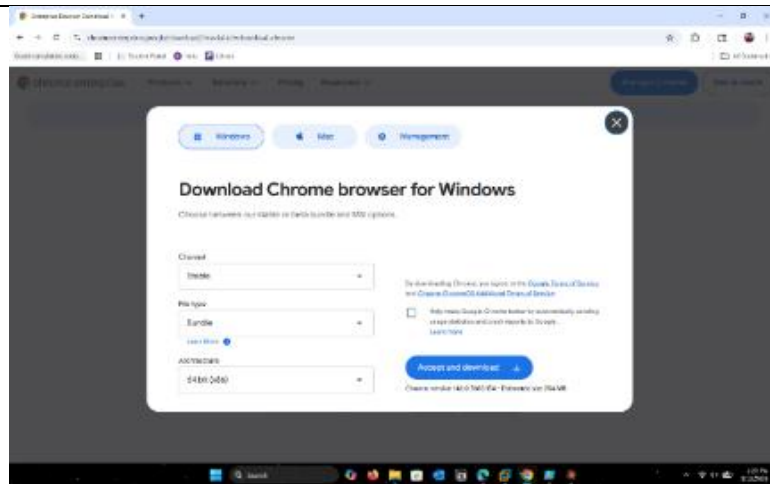

- Write the title "Legal Notice".

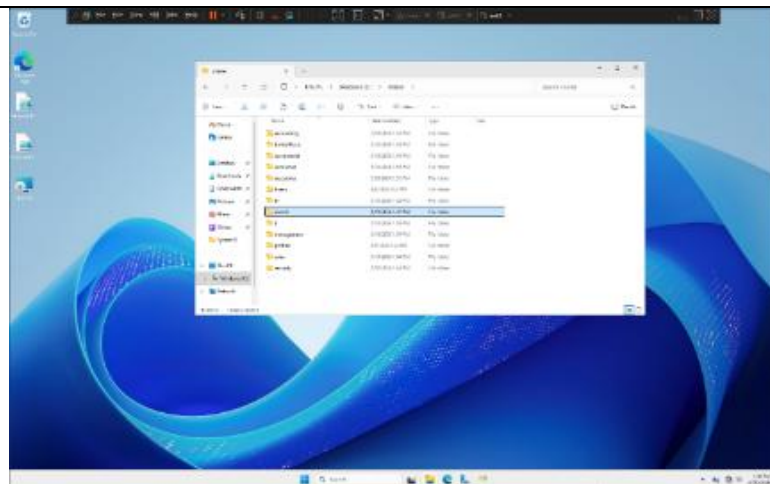

- Find the policy named Interactive Logon Message Text and paste your legal notice in the text prompt.

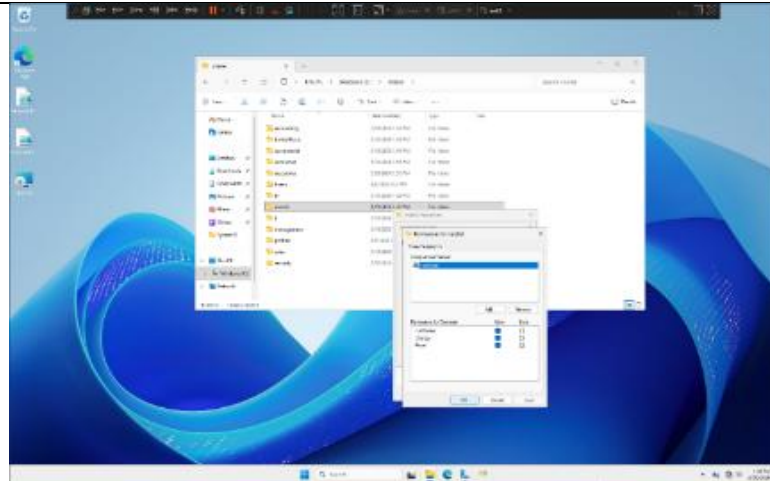

- Open an internet browser and find a redistributable installer for Google Chrome.

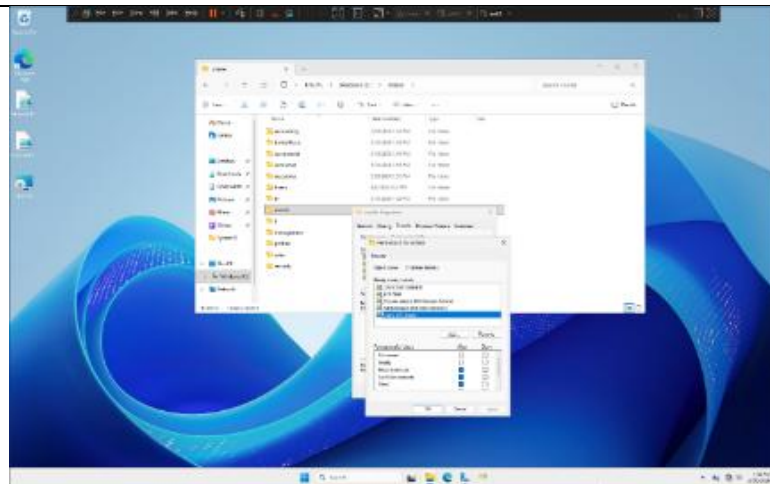

- Paste the chrome.msi installer onto the desktop of the server, and then move it to the folder installs.

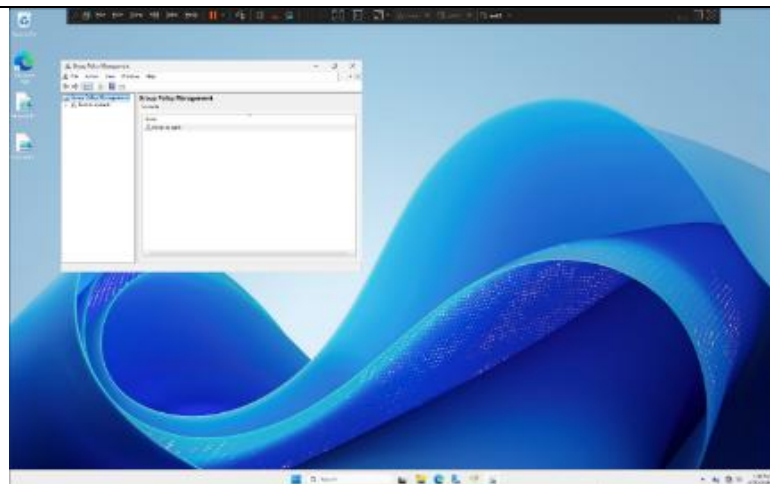

- Under permissions for the folder installs allow full control for Everyone.

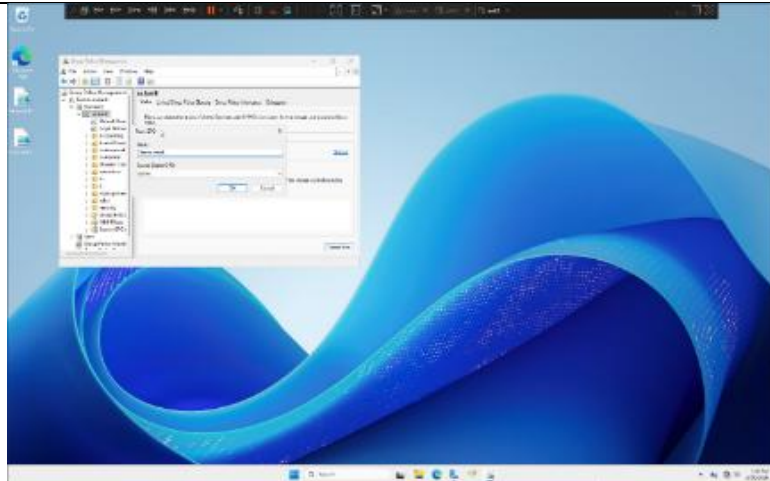

- Under the share permissions add Users and set their permissions to Read & Execute.

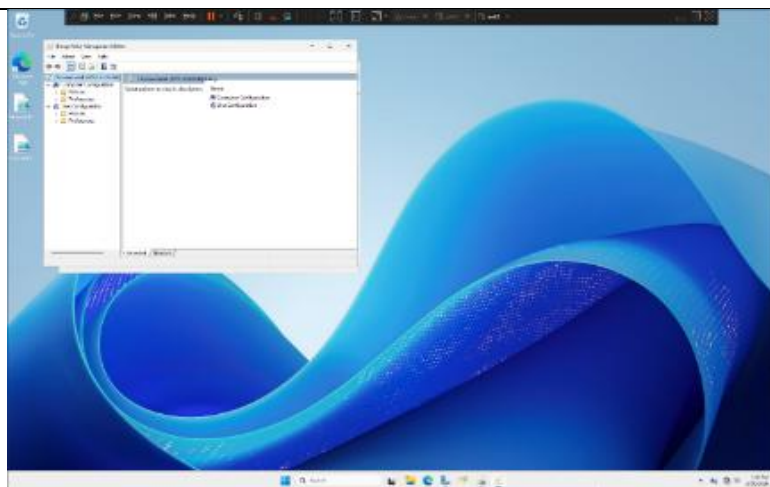

- Open Group Policy Management.

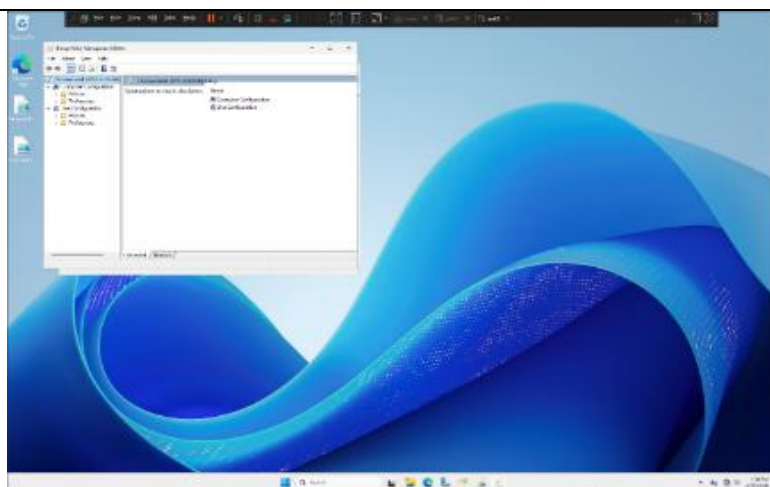

- Right click on the domain and create a new GPO named “Chrome Install”.

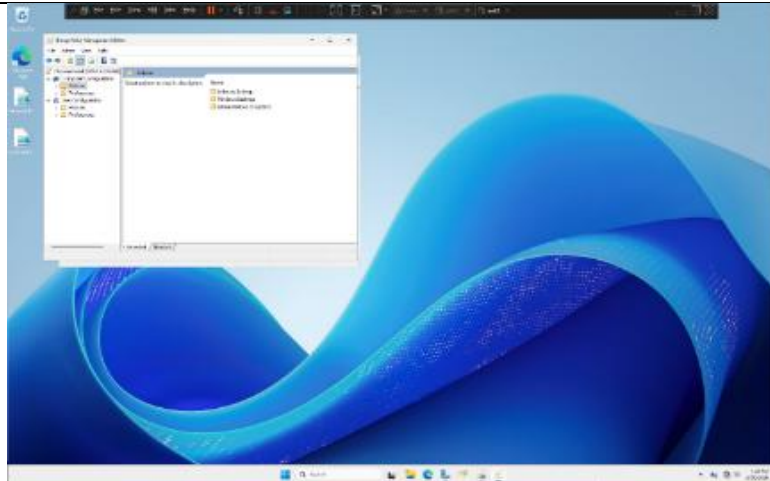

- Right click on the new policy and hit “Edit”.

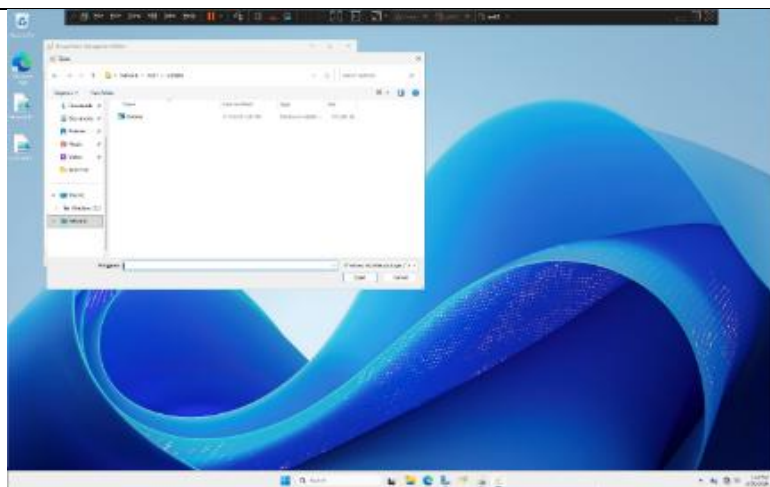

- Navigate to the Group Policy Management Editor.

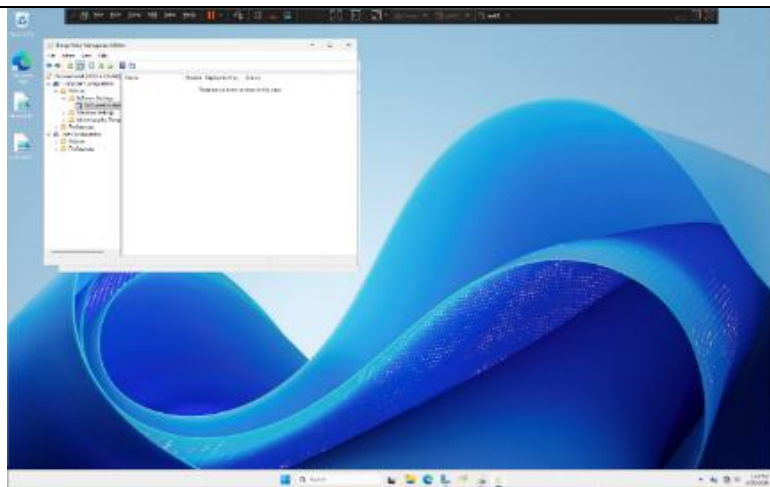

- Under Computer Configuration, select Policies.

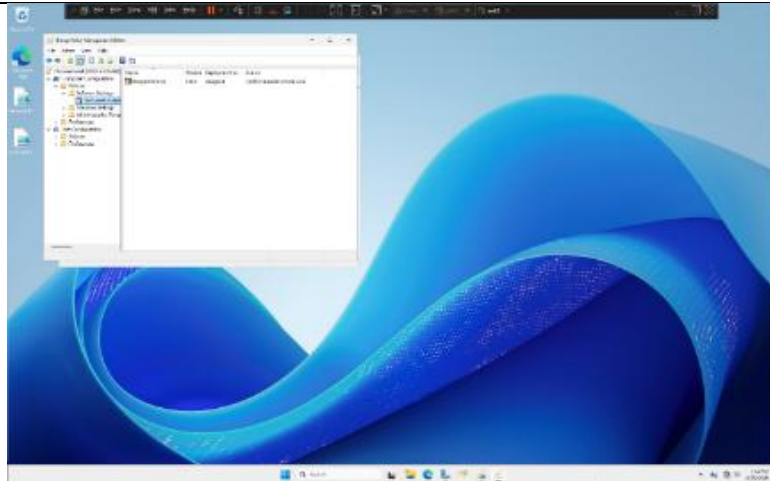

- Under Software Settings, select Software Install and select the chrome.msi file from earlier.

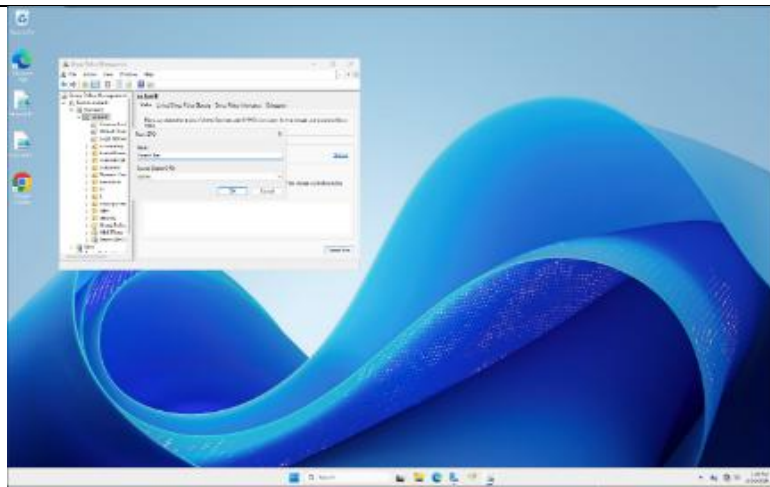

- Make sure to select Assigned install when the dialogue box sets up.

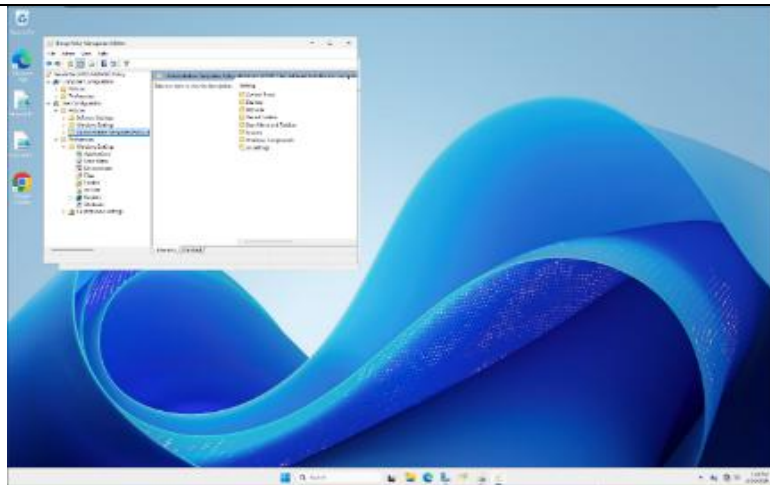

- When done correctly, you will see Google Chrome listed with the correct location and the Deployment set to Assigned.

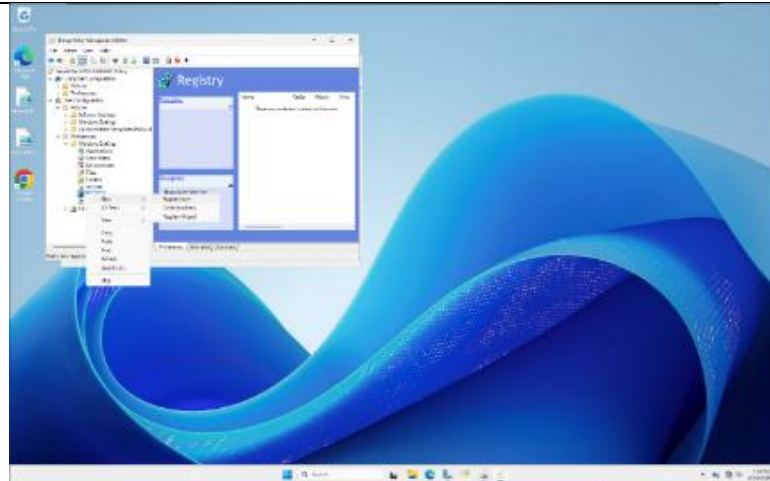

- Right click on the domain, and create a new GPO named Search Bar.

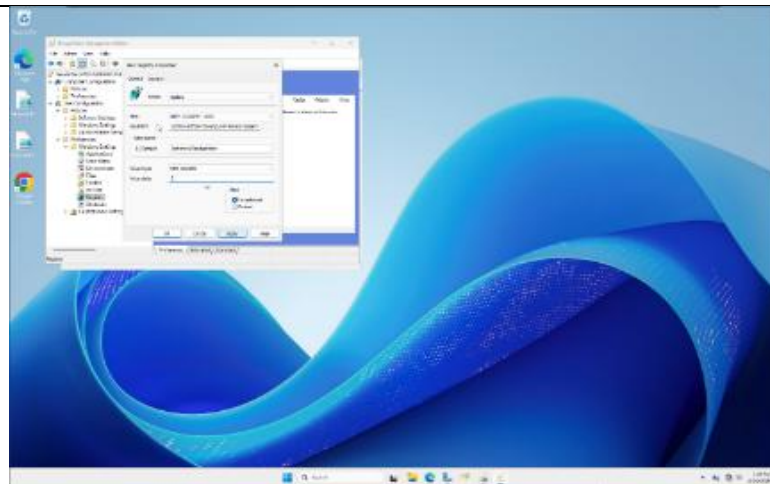

- Edit the new policy and under User Configuration go to Preferences.

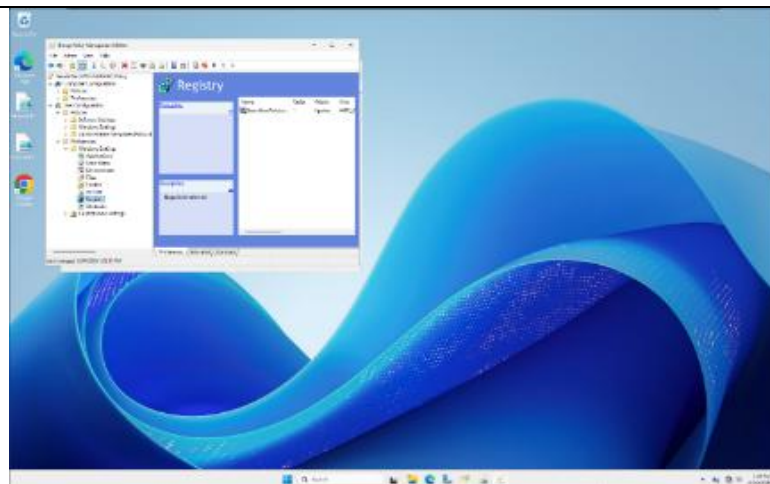

- Under Windows Settings and right click Registry and select New and then Registry Item.

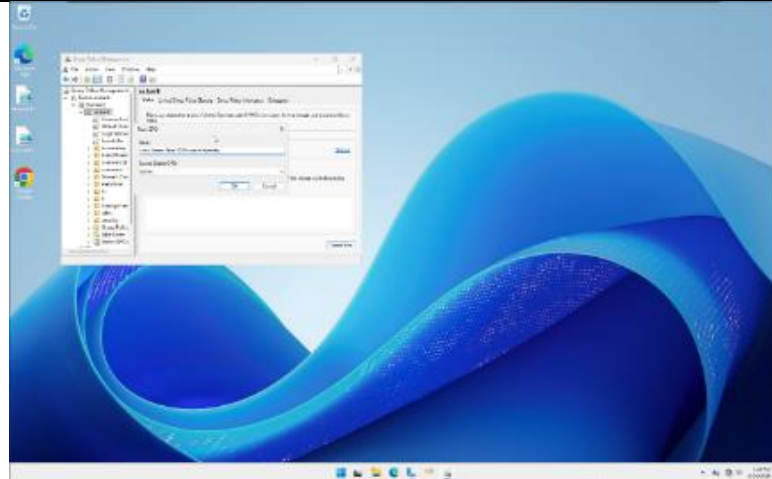

- Fill out the Registry Properties as seen.

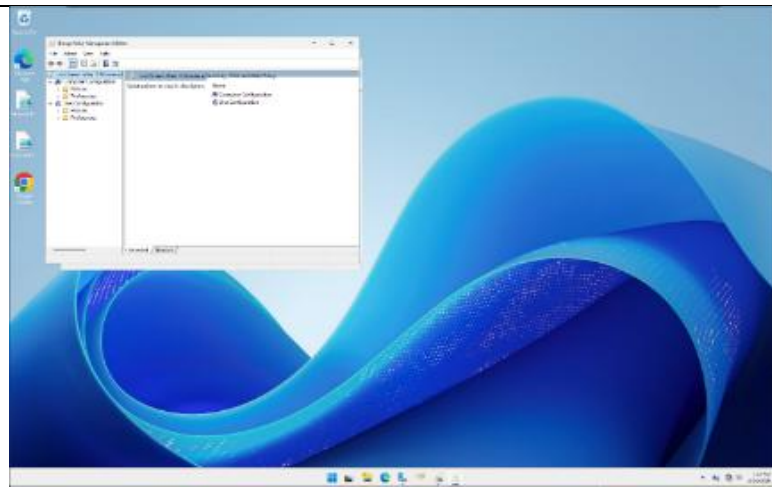

- If done correctly, you should see a new item with the name SearchboxTaskbar.

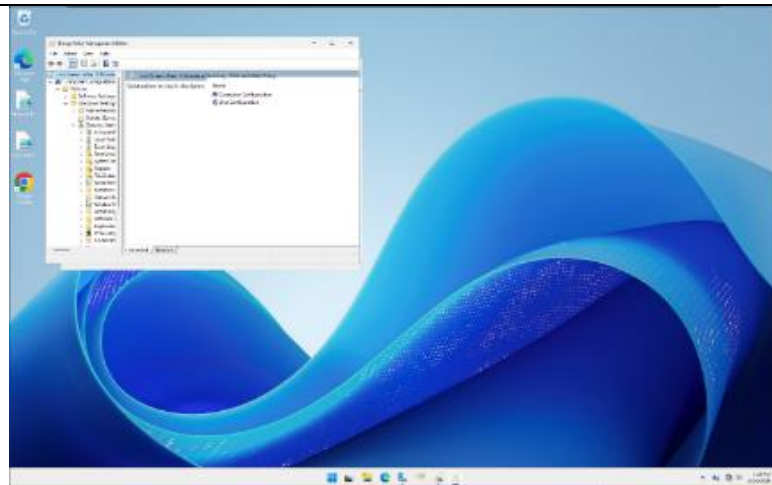

- Right click on the domain, and create a new GPO named Lock Screen After 10 Minutes of Inactivity.

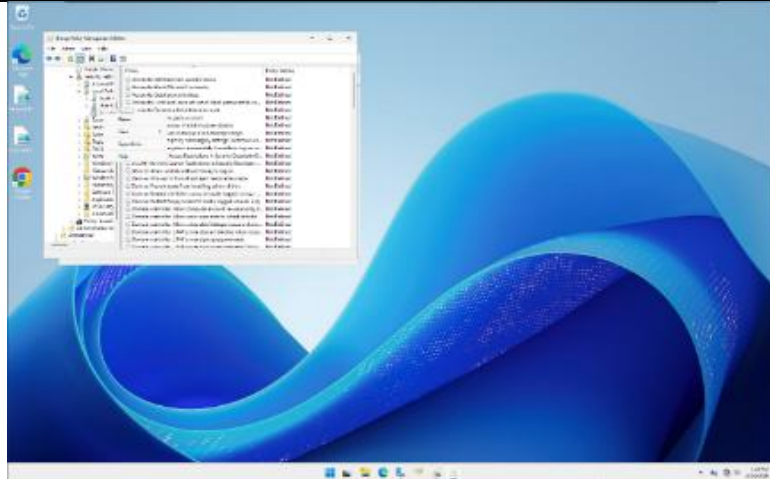

- Click edit on the policy.

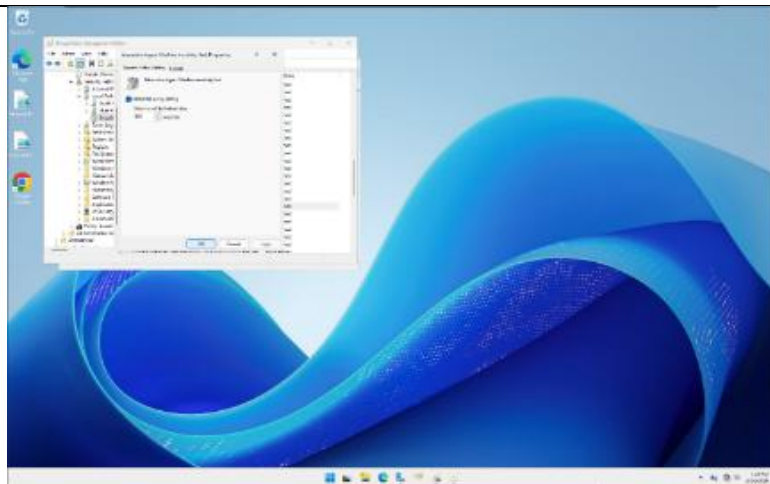

- Under Computer Configuration go under Policies, then under Windows Settings, then under Security Settings.

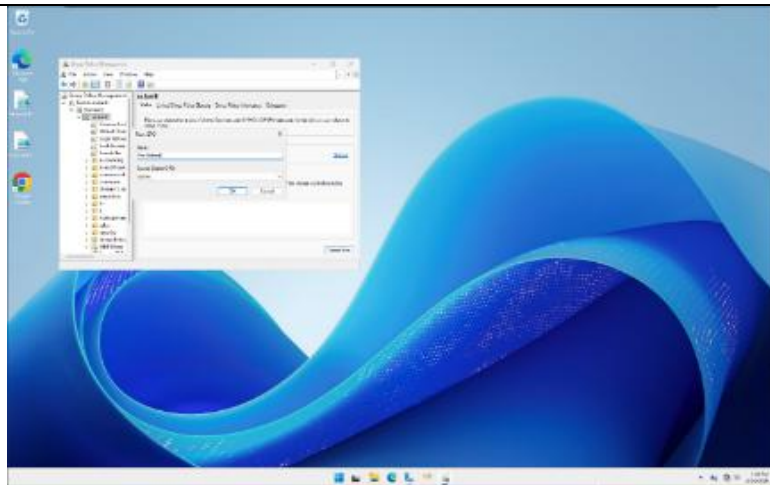

- Under Security Settings, go under Local Policies, then right click on Security Options and click open.

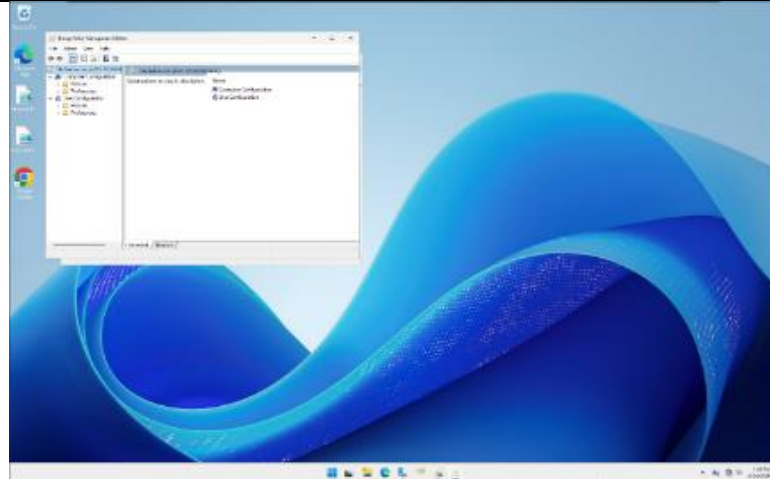

- Find the policy named Interactive Logon Machine Inactivity Limit and define it as 600 seconds.

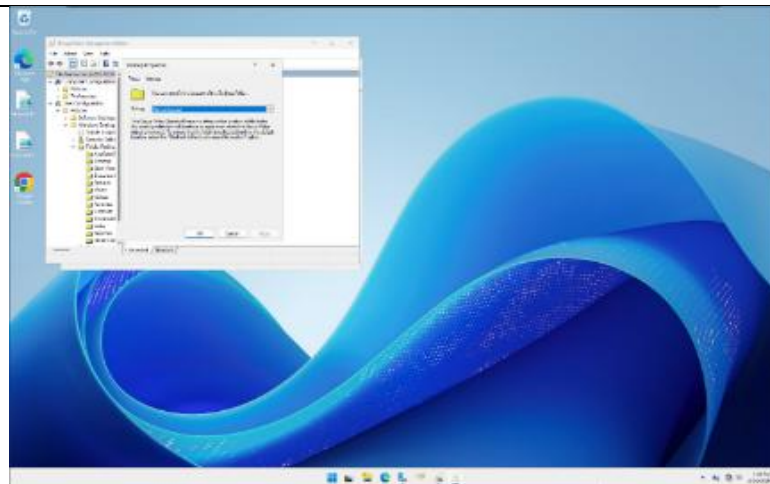

- Go back and right click on the domain and create a new GPO named File Redirection.

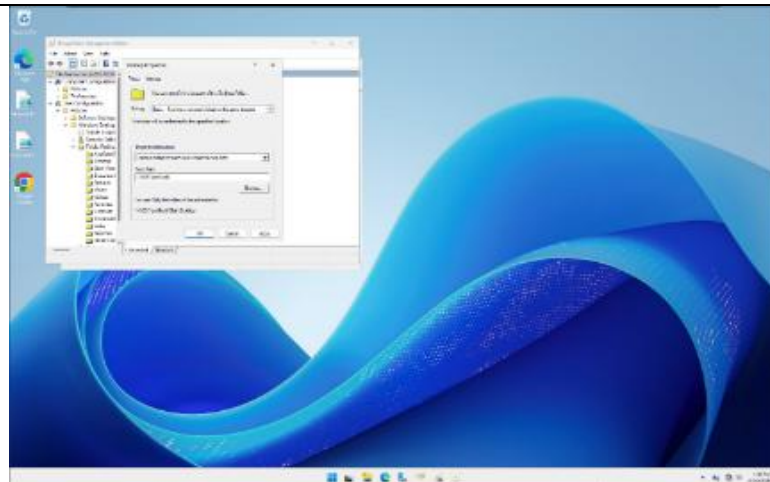

- Edit the policy.

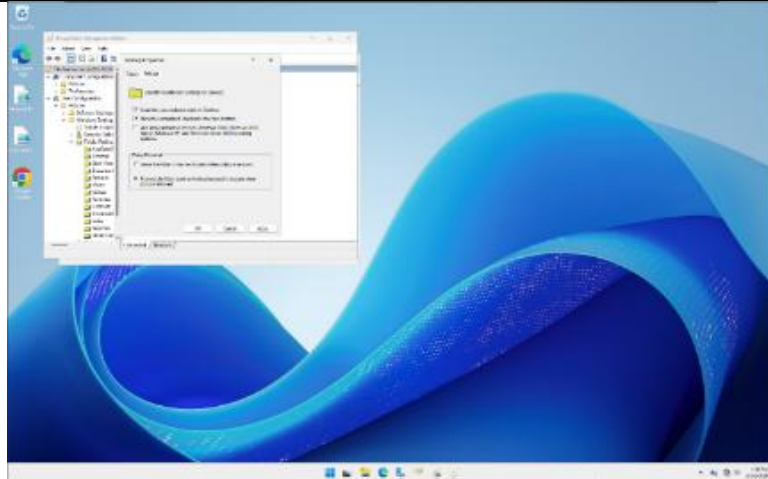

- Under User Configuration go to Policies then Windows Settings then under File Redirection double click on Desktop.

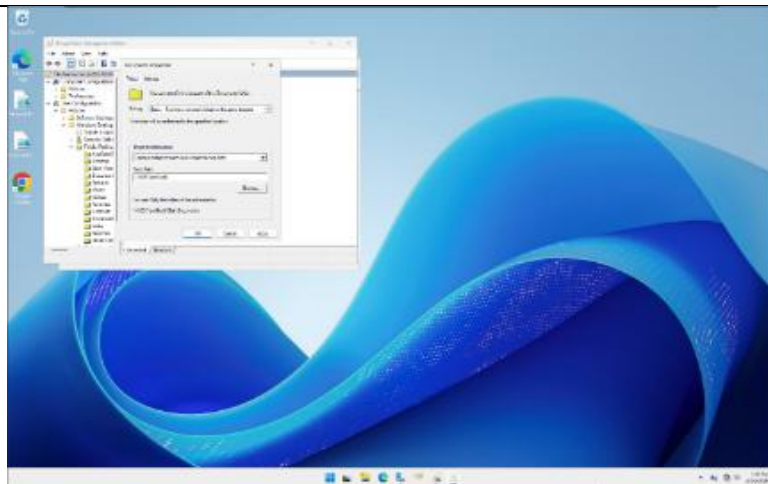

- Fill out the Desktop Properties to match the screenshot.

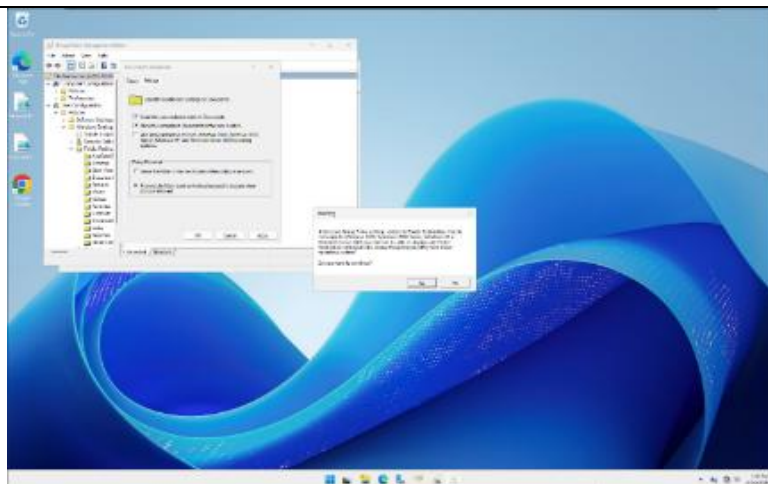

- Under the Settings tab select “Redirect the folder back to the local...” and apply.

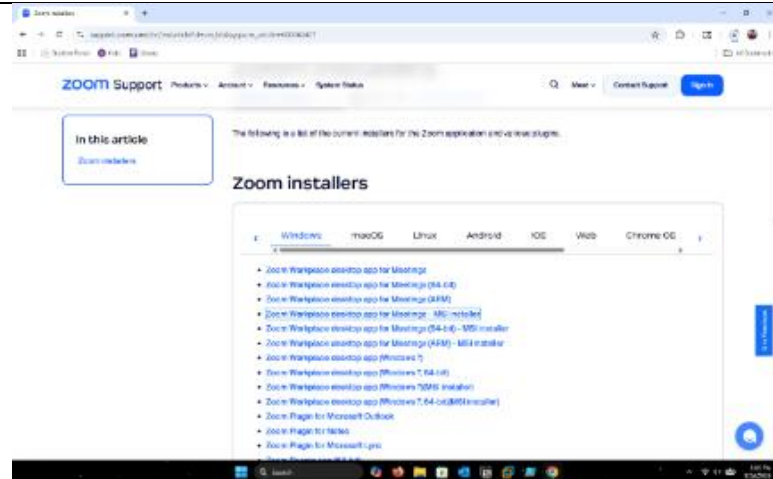

- Double click on Documents and fill out the same.

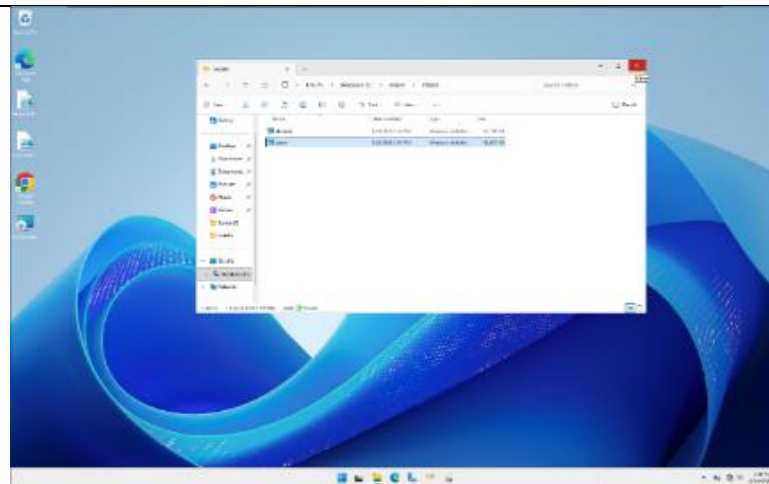

- You might get a warning that the policy will not apply to older machines, continue past this.

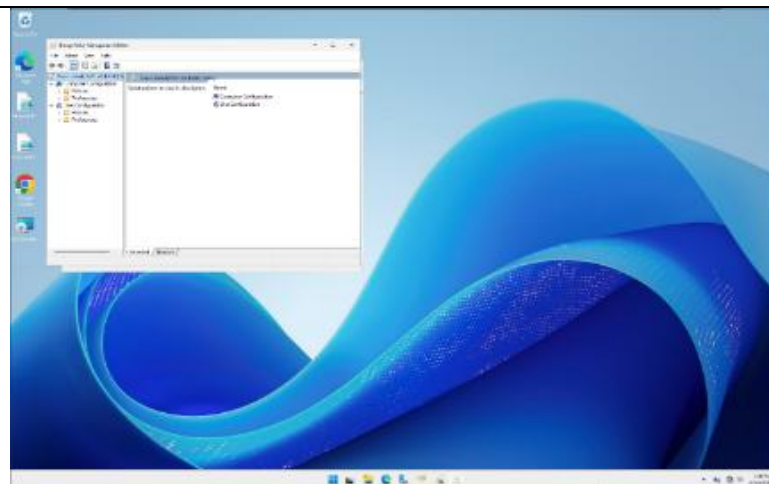

- Open up a internet browser and find a redistributable installer for Zoom.

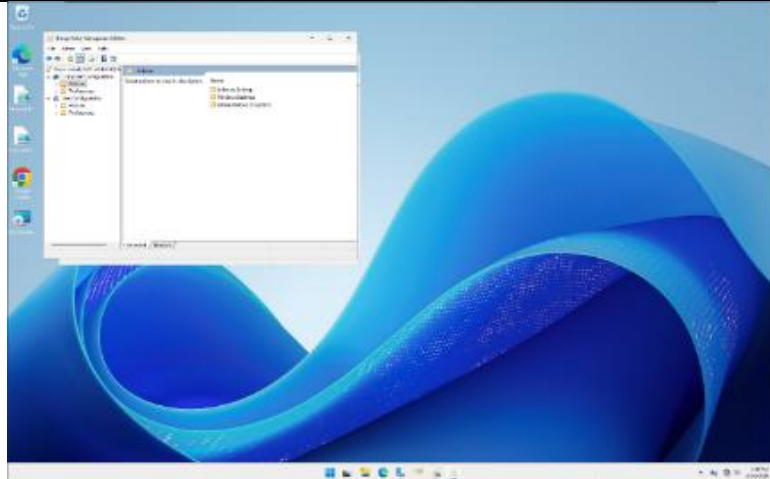

- Place the zoom.msi installer in the same installs folder as chrome.

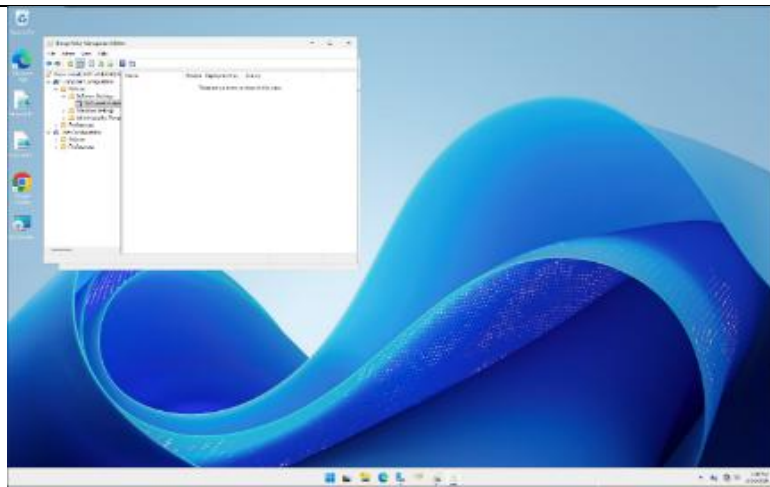

- Create a GPO under the domain named Zoom Install.

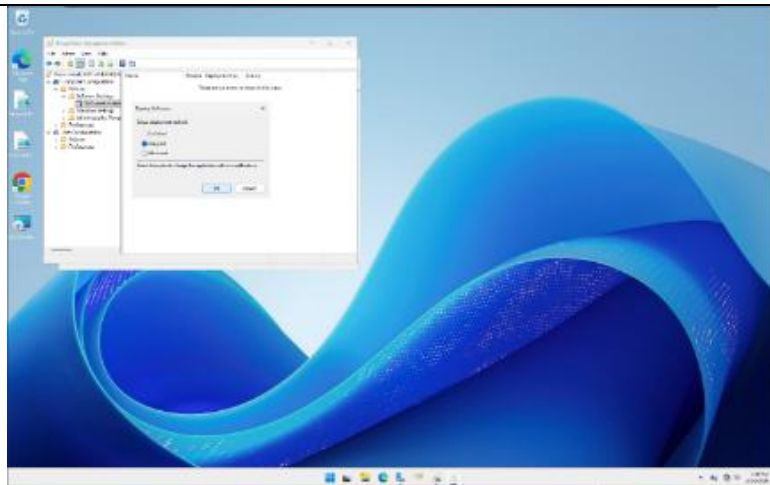

- Select Policies under Computer Configuration.

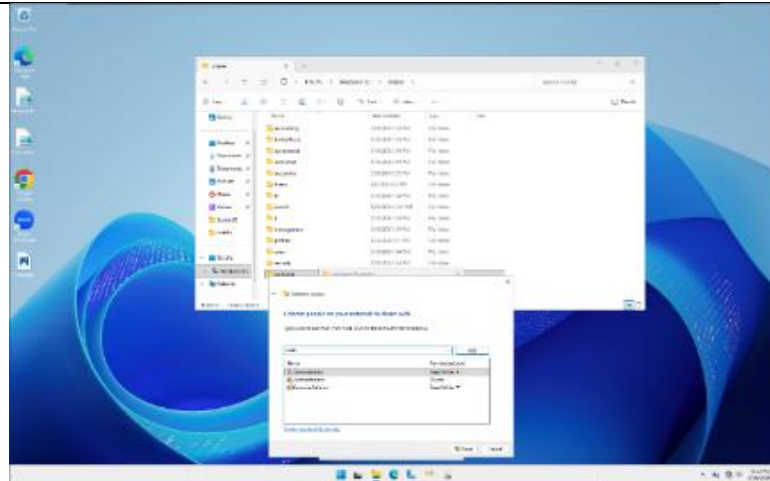

- Select Software Settings and Software Installation.

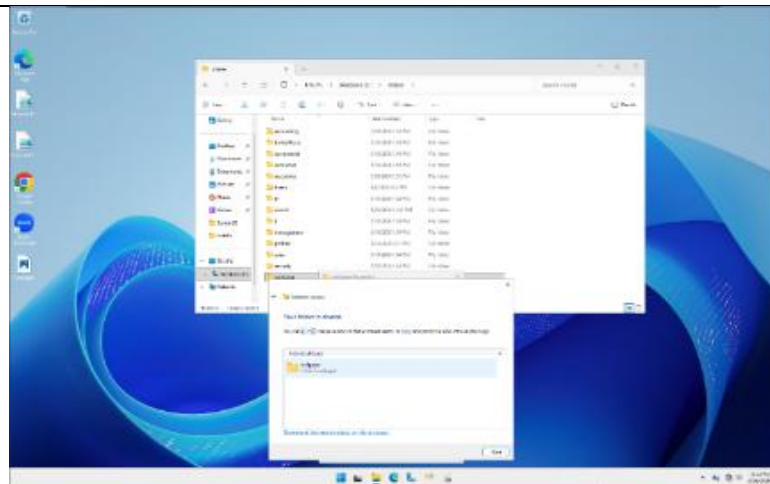

- Select Assigned under Deploy Software popup.

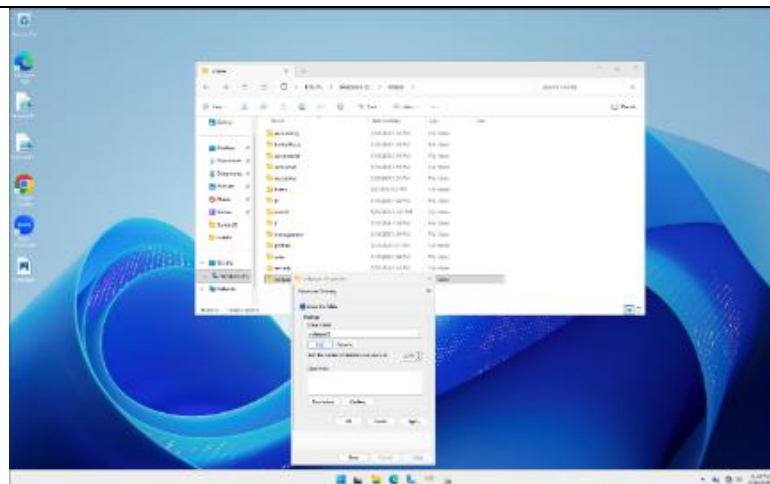

- Now under the shares folder create a folder named wallpaper and share it to everyone on the network.

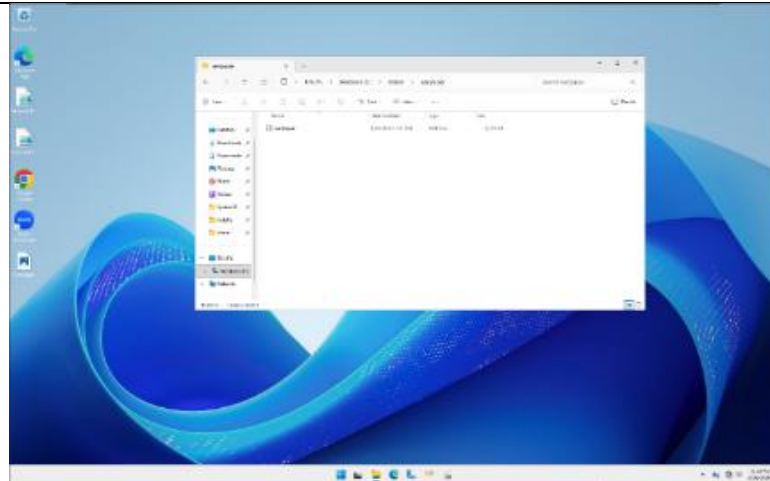

- Confirm the folder is shared as wallpaper\$ so it is hidden.

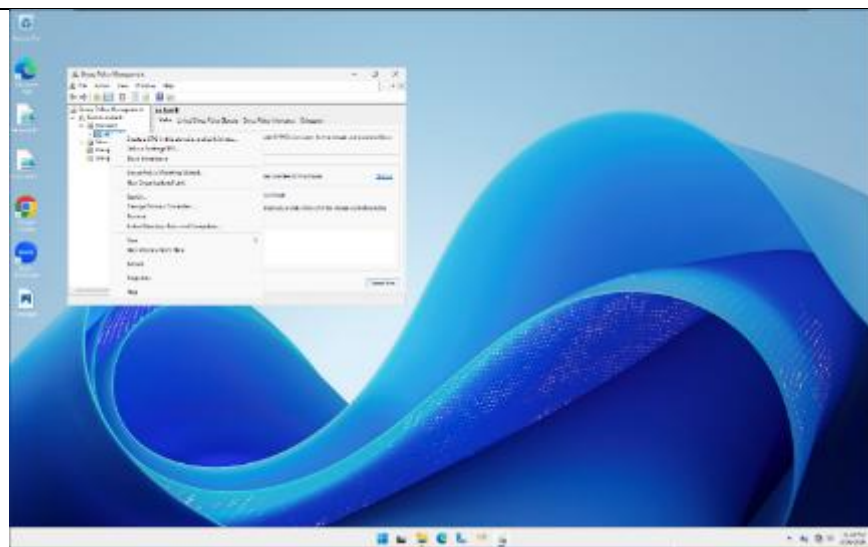

- You might need to go under the folder properties to change this.

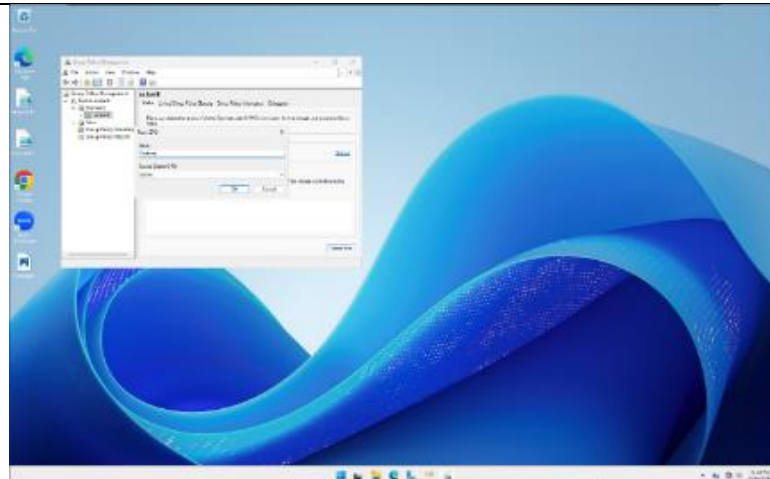

- Move an image you wish to be the background into the new folder.

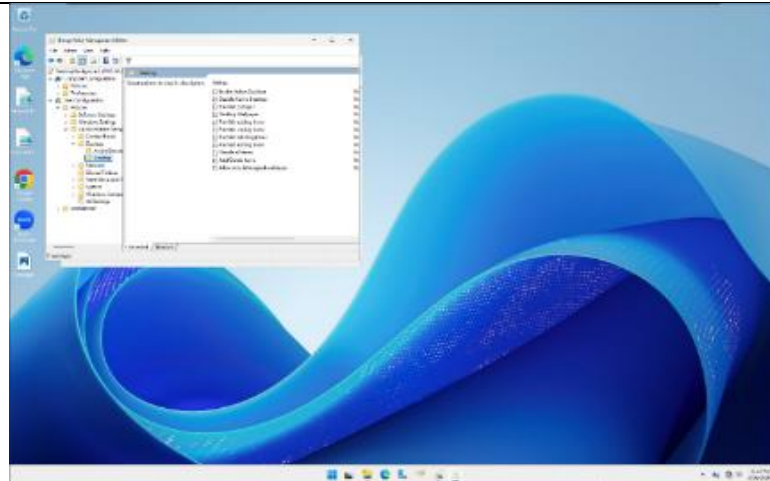

- Reopen the Group Policy Management and create a GPO under the domain.

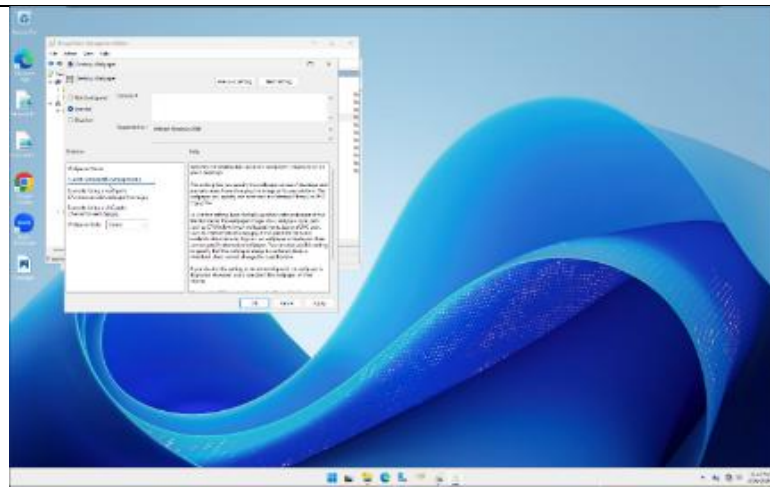

- Name the GPO Desktop Background.

- Click edit and under User Configuration go to Administrative Template Settings, then to Desktop and under Desktop select Desktop Wallpaper.

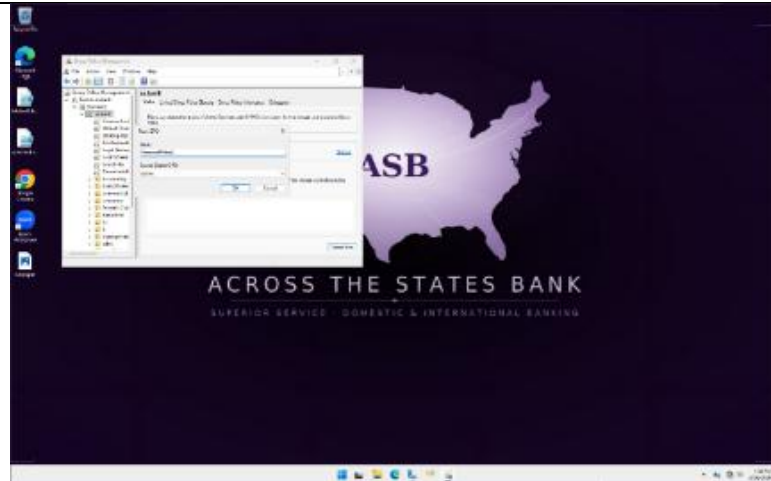

- Click enable and copy the pathway to the image file you used and hit apply.

- Go back to Group Policy Management and create a policy.

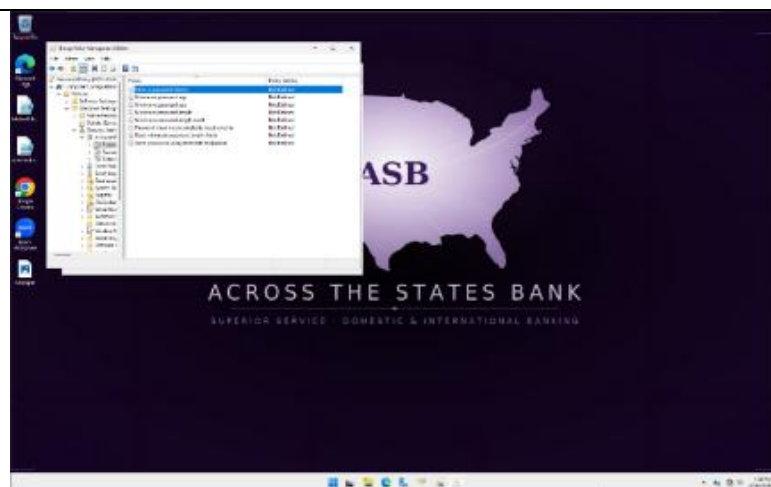

- Name the policy
Password Policy.

- Click edit and
under Computer
Configuration go
to Windows
Settings then to
Security Settings.

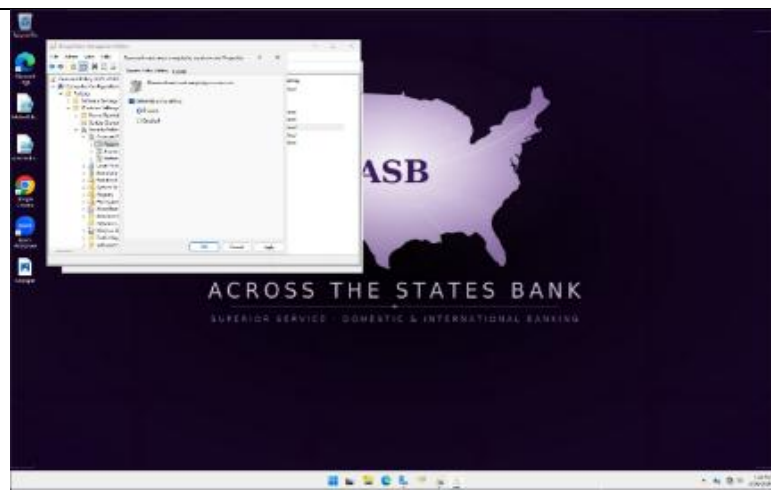

- Under Security
Settings go to
Account
Password.

- Define the maximum password age as 90 days.

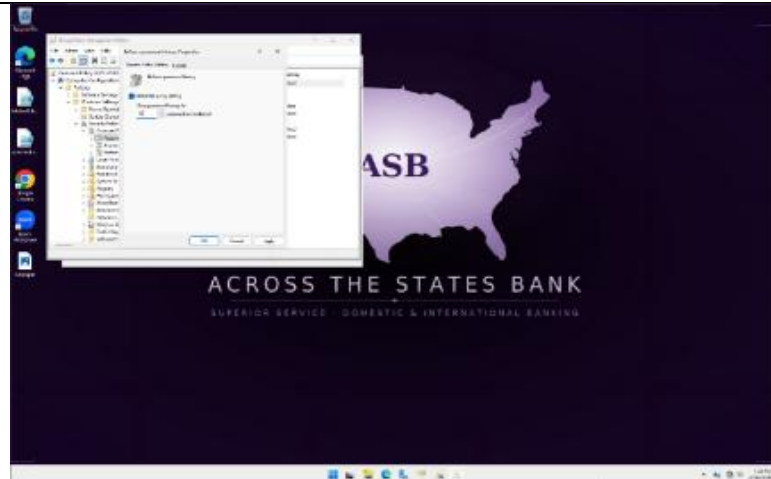

- Select enable for Password must need complexity requirements.

- Define the Minimum Password length as 8 characters.

- Enforce password history for 12 passwords remembered.

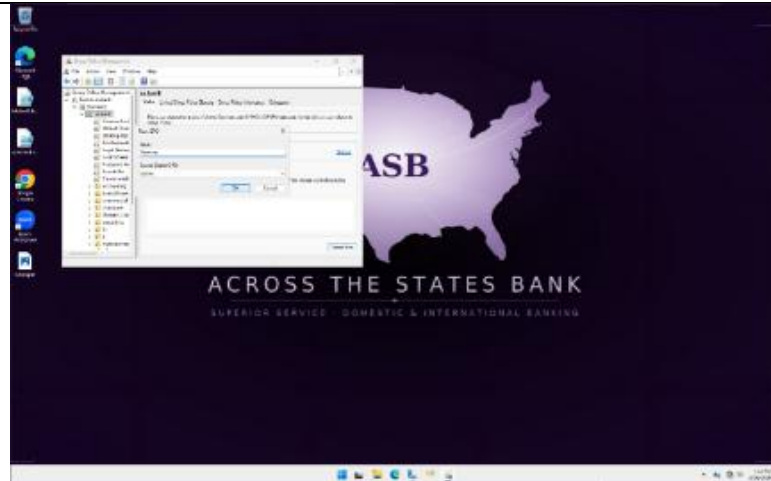

- Change the minimum password age to 30 days.

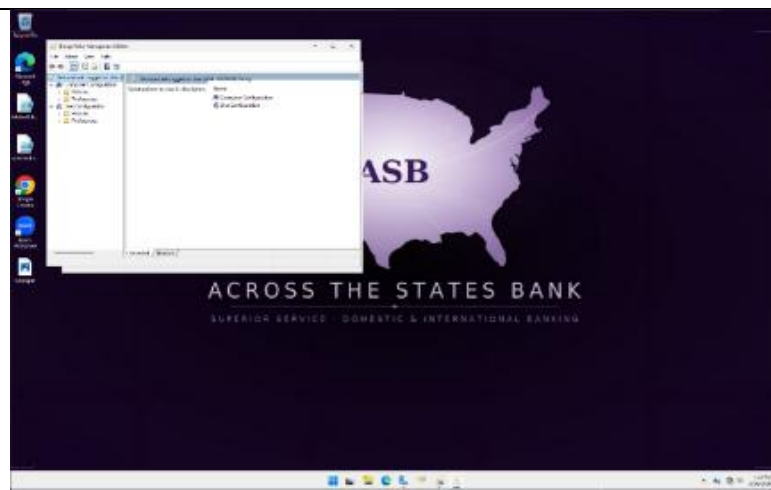

- Check to see if your password policies match the screenshot.

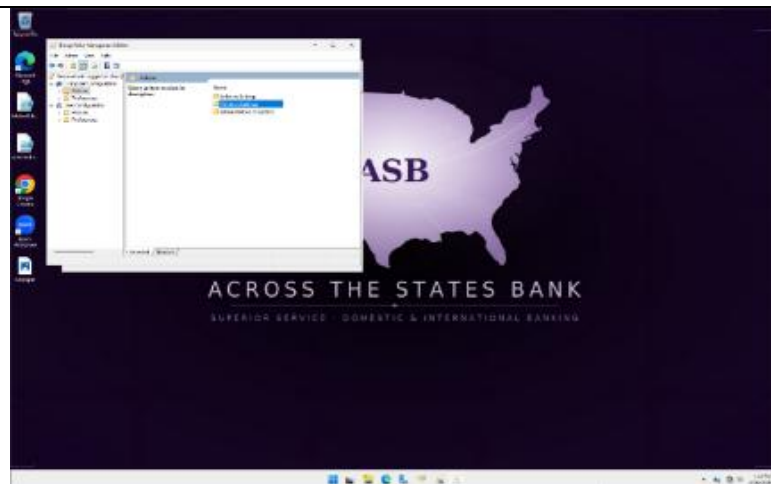

- Go back to Group Policy Management and under the main domain create a new policy named Remove Last-Logged on User

- Click edit on the policy to open the editor.

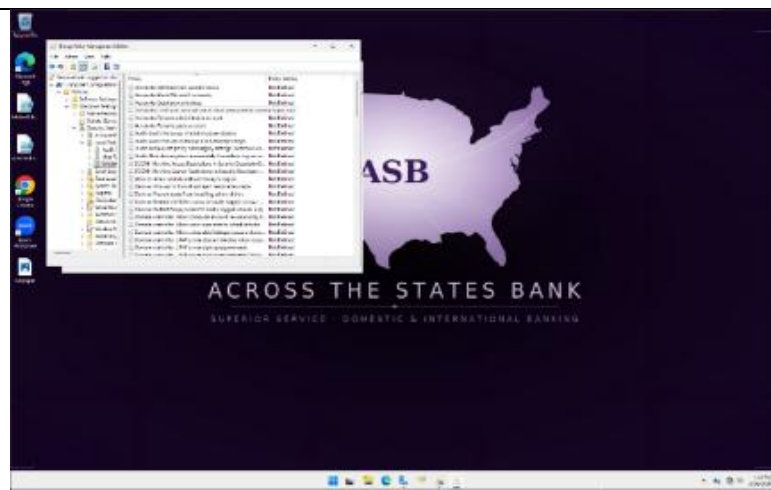

- Under Computer Configuration go to Policies and Windows Settings.

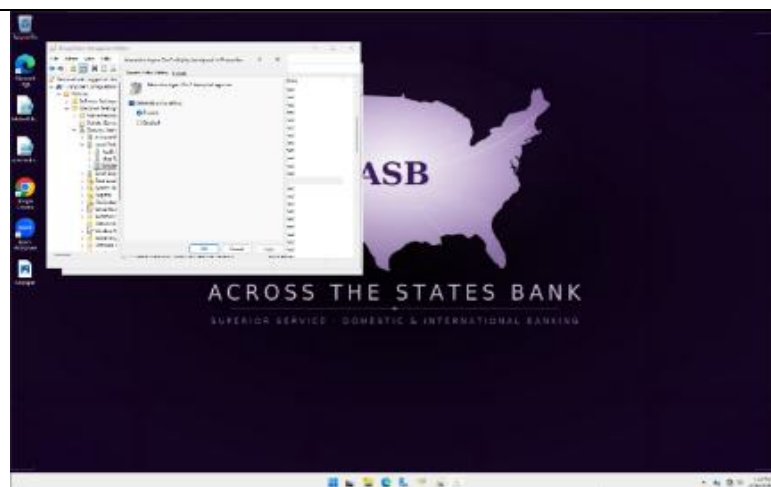

- Under Security Settings go to Local Policies.

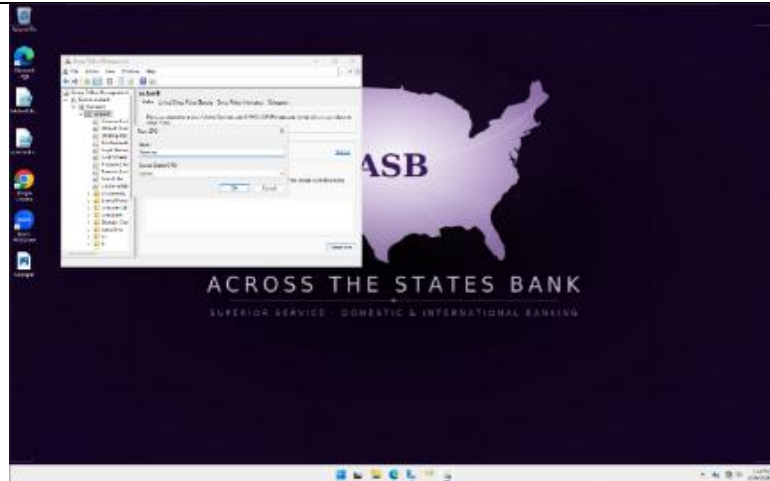

- Under Security Options find Interactive Logon Don't Display last signed-in.

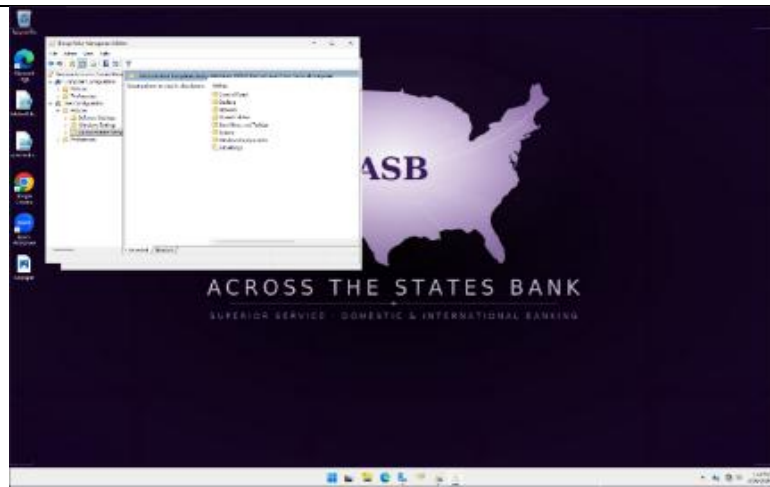

- Enable and define the policy.

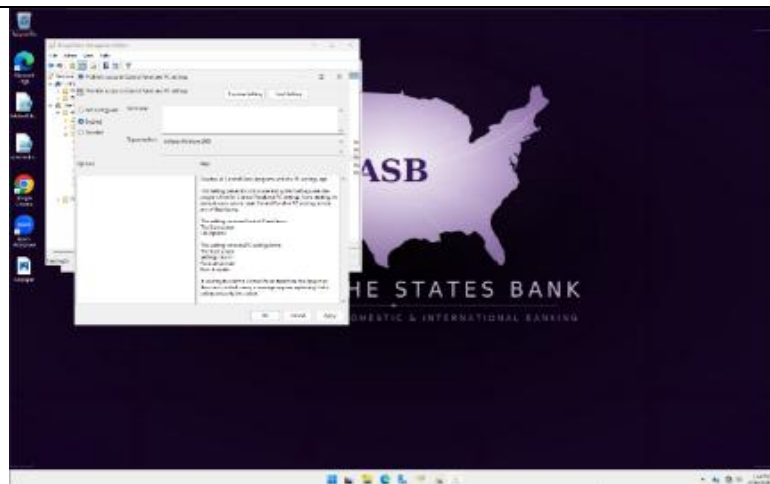

- Back on the Group Policy Management Window create a new GPO named Remove Access to Control Panel.

- Go under User Configuration and under Policies go to Administrative Templates Settings.

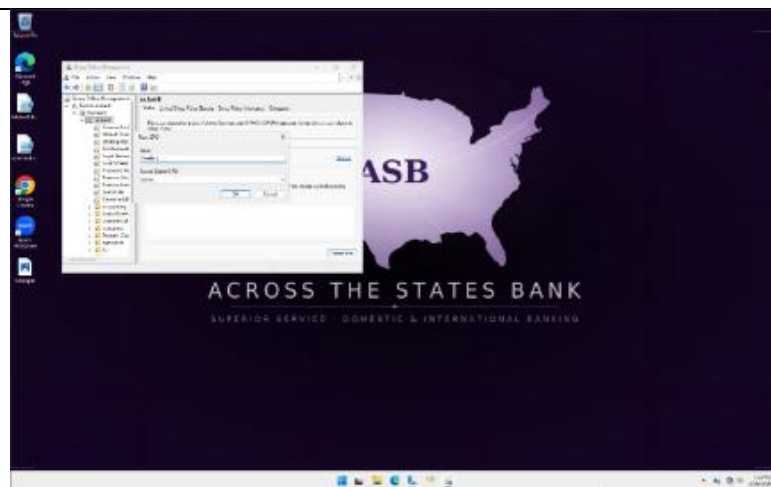

- Under Control Panel find Prohibit access to Control Panel and PC settings and click enable.

- Click enable and you should see the setting change on the Editor window.

- Create a new GPO named Disable the CMD.

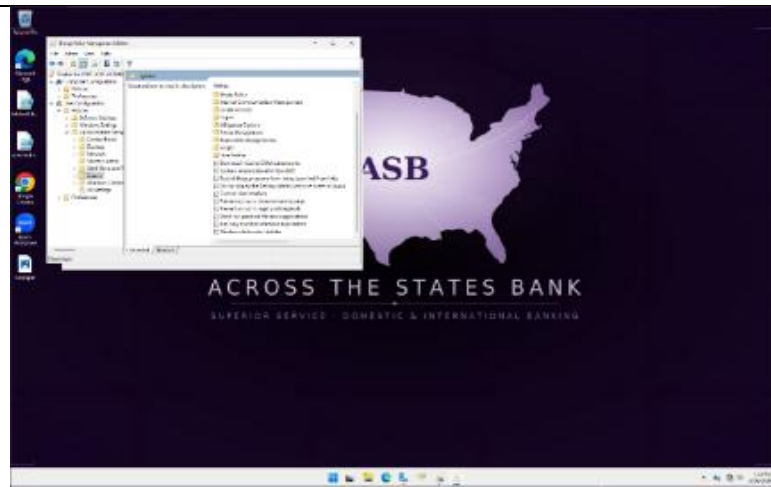

- Click Edit and go under User Configuration.

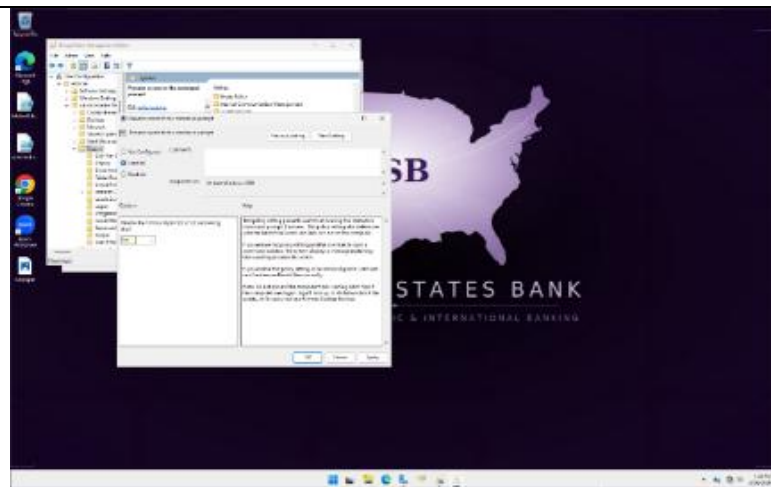

- Under Policies go to Administrative Template Settings.

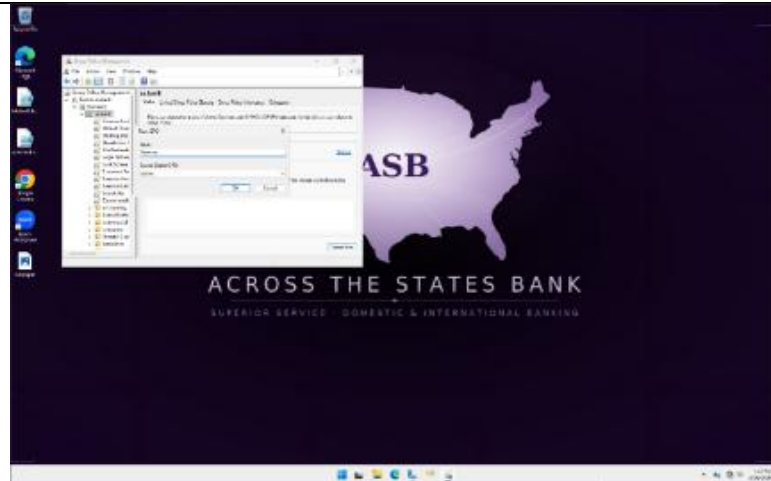

- Go to System.

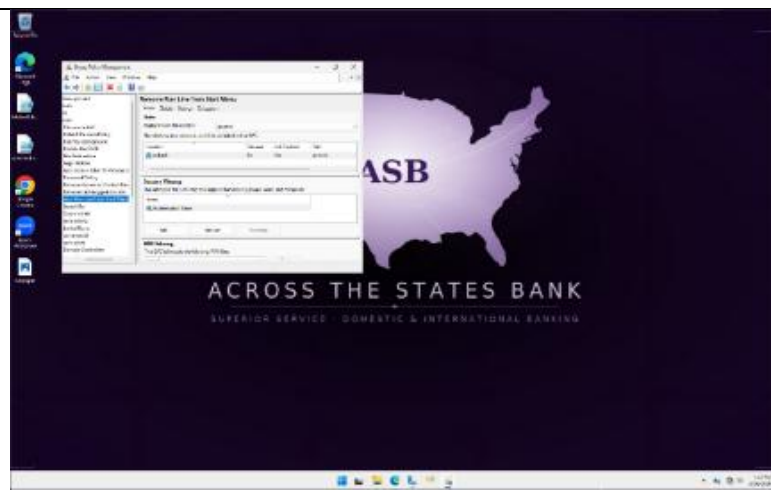

- Find Prevent access to the command prompt and enable it.

- Create a new GPO named Remove Run Line from Start Menu.

- Right click on the new policy and select Edit.

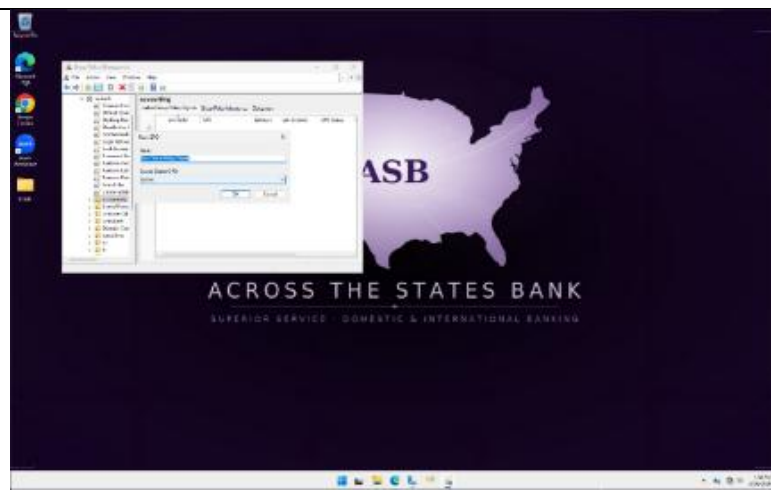

- Under User Configuration -> Administrative Settings -> Start Menu and Taskbar

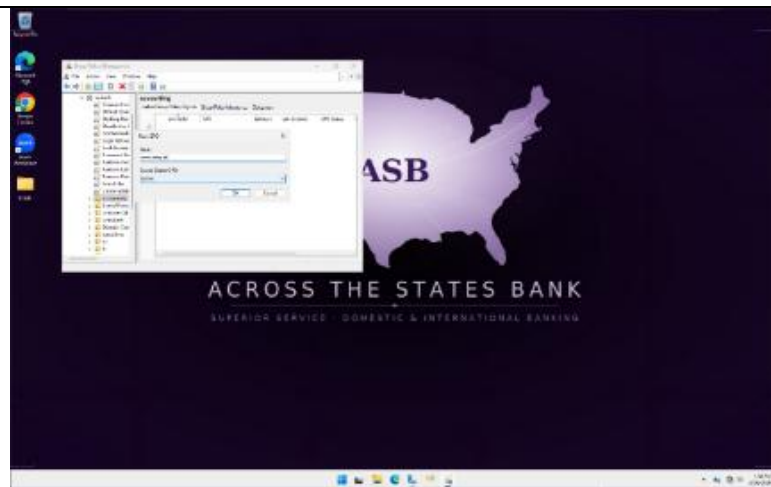

- Enable the policy
Remove Run menu
from Start Menu.

- Now under the
accounting group
create a GPO
named accounting
drive.

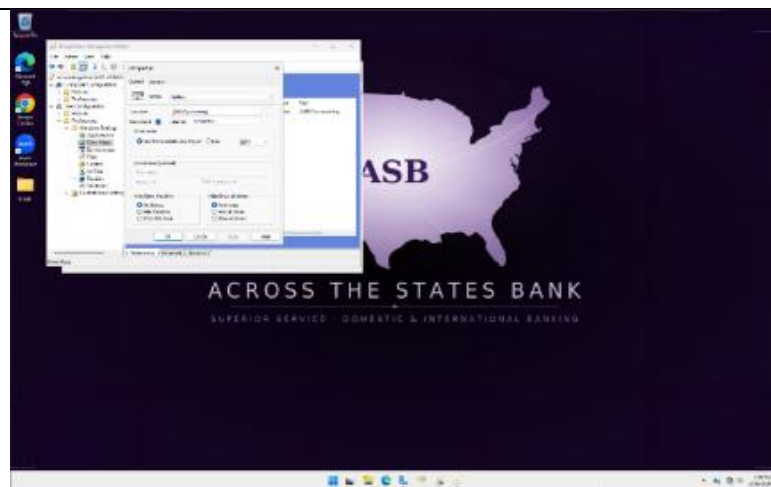

- Keep the source
as none.

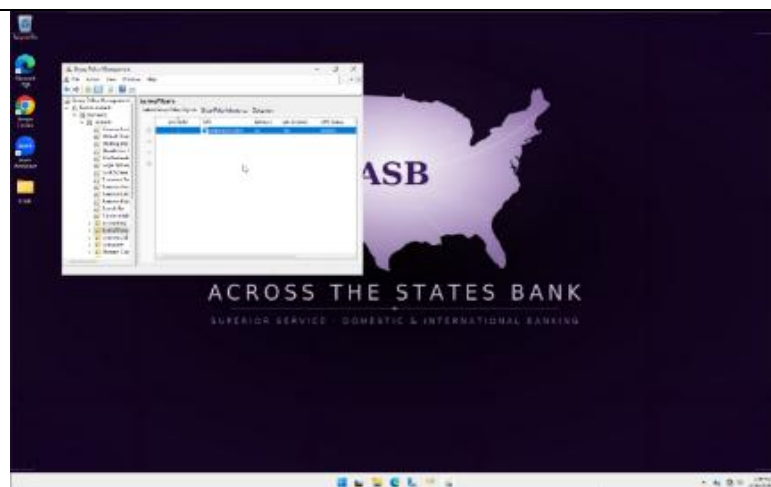

- Right click on the new policy and select Edit.

- Under User Configuration -> Preferences -> Windows Settings -> Drive Maps. Fill out the window as seen in the screenshot with the respective drive names.

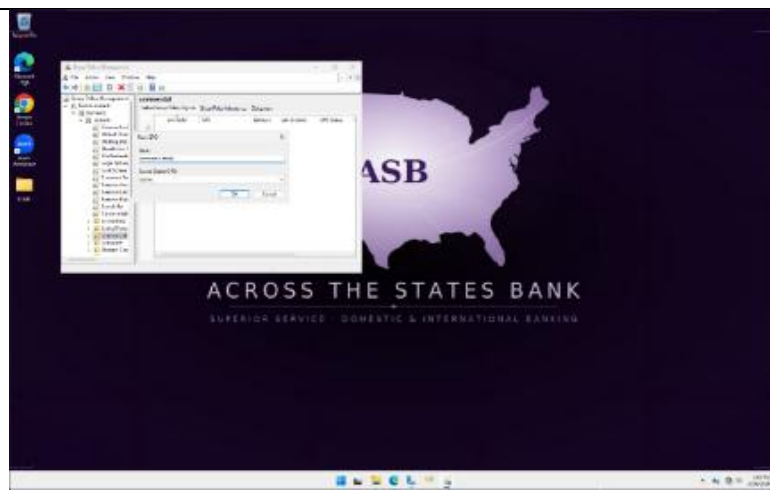

- Do the same under the bankofficers group.

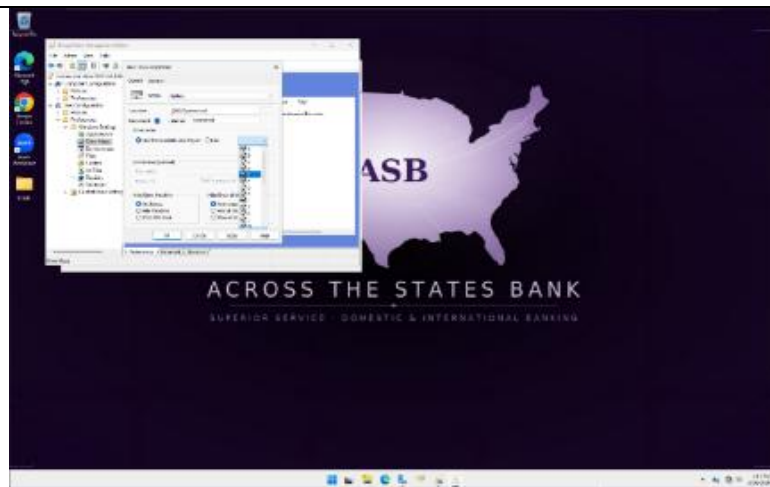

- Fill out the window as seen in the screenshot with the respective drive names.

- Do the same under the commercial group.

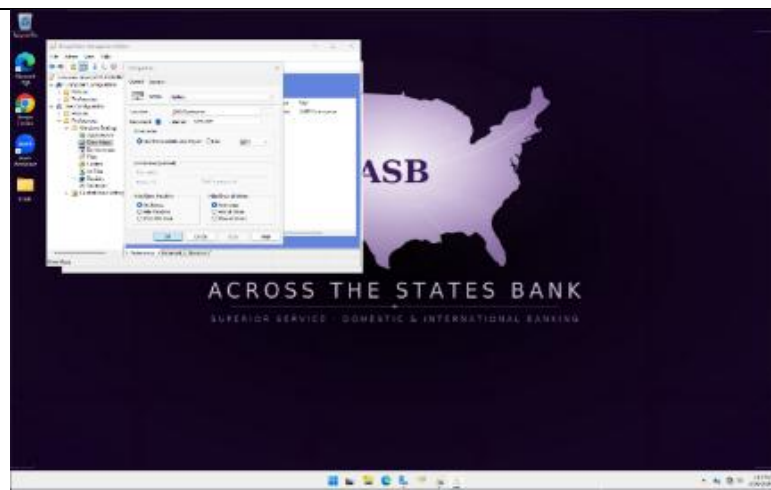

- Fill out the window as seen in the screenshot with the respective drive names.

- Do the same under the consumer group.

- Fill out the window as seen in the screenshot with the respective drive names.

- Do the same under executives. Fill out the window as seen in the screenshot with the respective drive names.

- Do the same under hr.

Fill out the window as seen in the screenshot with the respective drive names.

- Do the same for IT.

Fill out the window as seen in the screenshot with the respective drive names.

- Do the same for management.

Fill out the window as seen in the screenshot with the respective drive names.

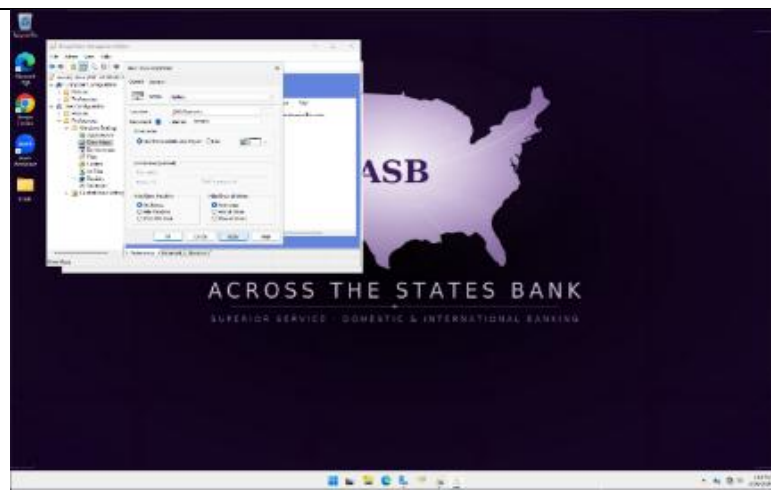

- Do the same for sales.

Fill out the window as seen in the screenshot with the respective drive names.

- Do the same for security.

Fill out the window as seen in the screenshot with the respective drive names.

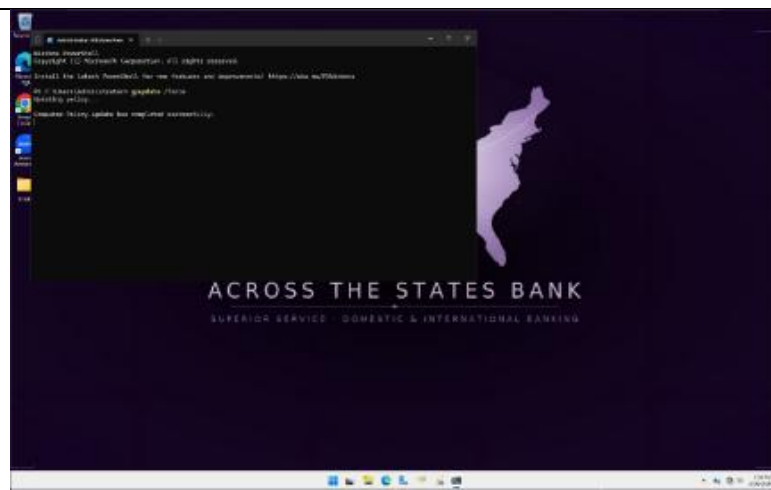

- Open a new CMD window and you will see access has been disabled.

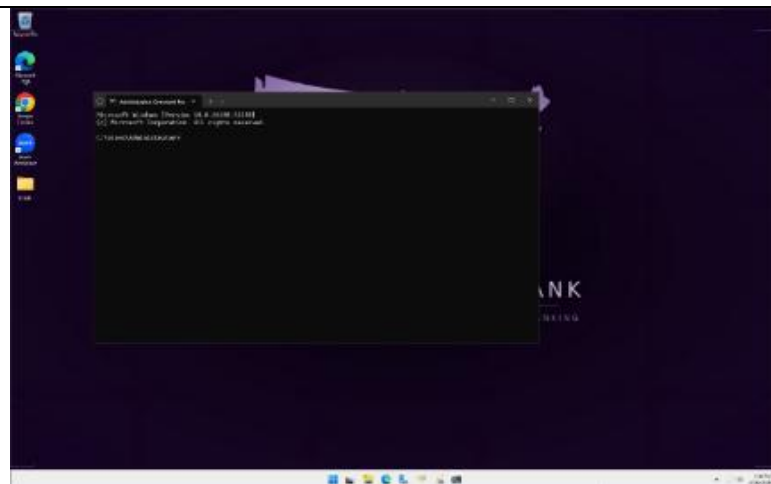

- To fix this, select the Disable the CMD policy and under Scope set Domain Admin permissions to as seen.

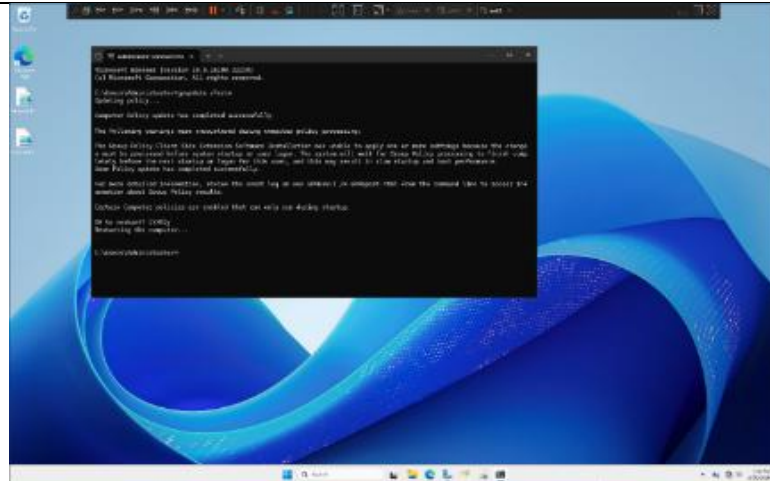

- Open a Powershell window as Administrator and run `gpupdate /force`.

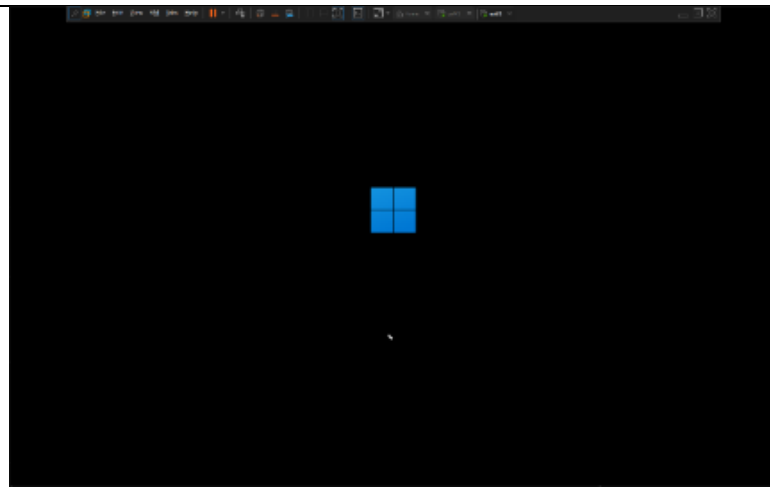

- Restart the machine and you will have access to the CMD now.

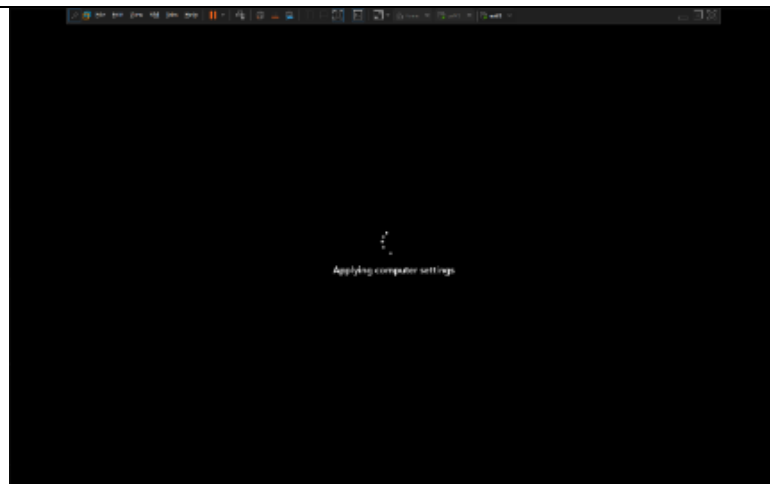

- Run gpupdate /force from the CMD and you will be asked to restart the computer.

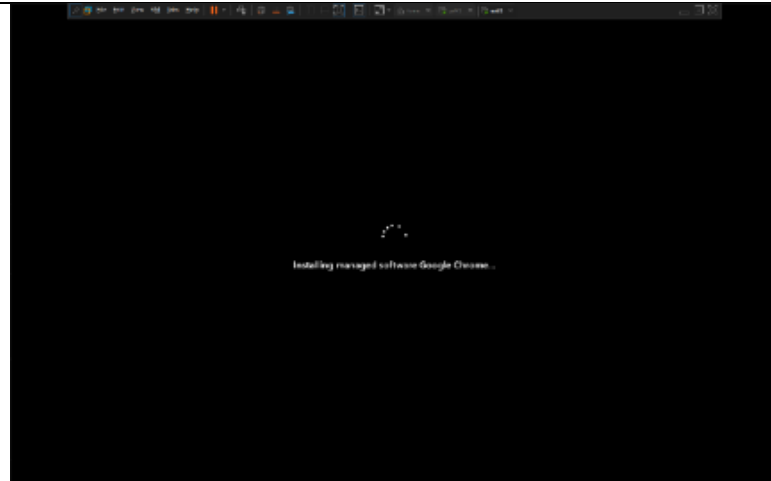

- Turn the machine back on.

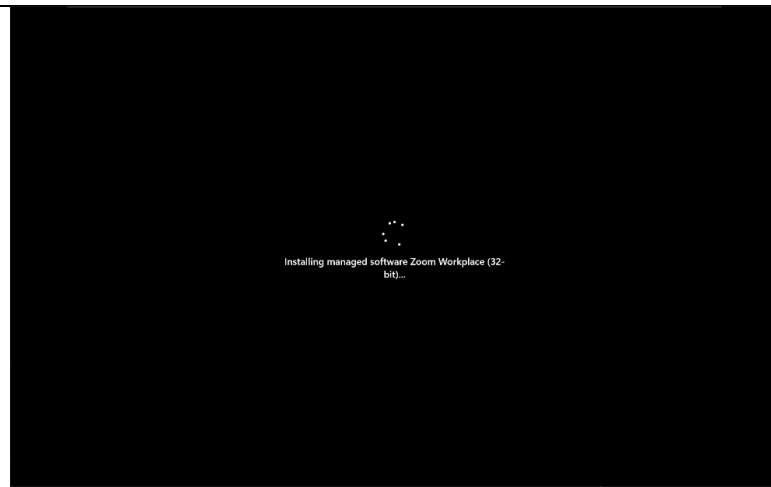

- The computer will apply the appropriate settings.

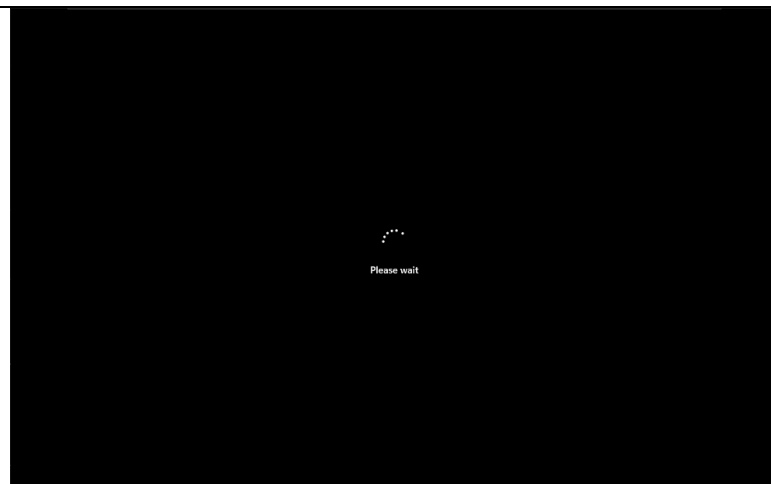

- The computer will install Google Chrome.

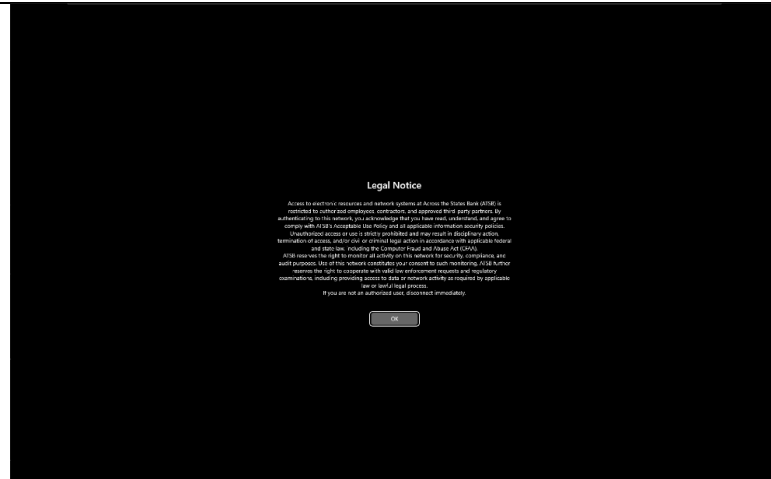

- The computer will install Zoom.

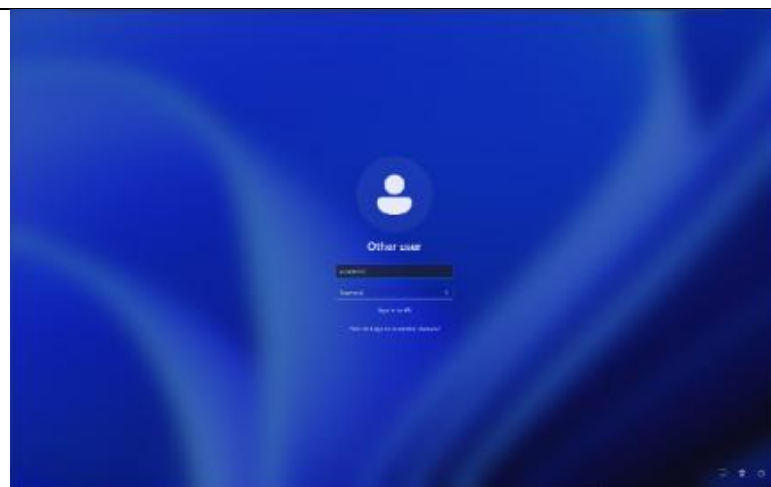

- Please wait for further policies to be updated.

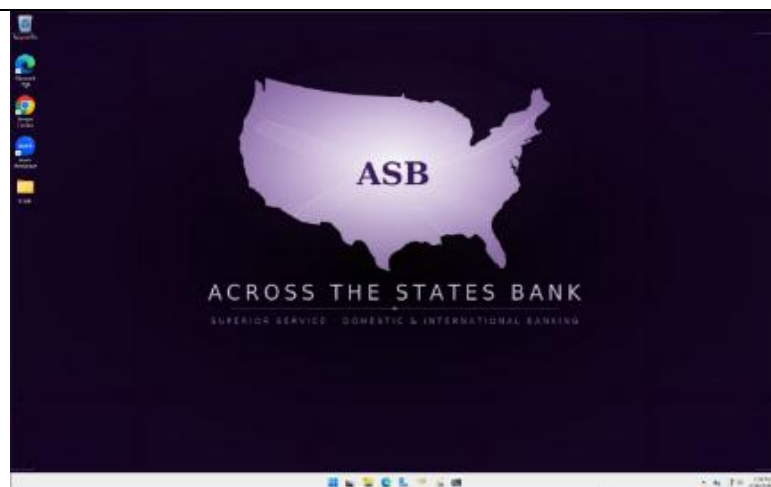

- You will see a legal notice upon trying to sign into the machine.
Success!

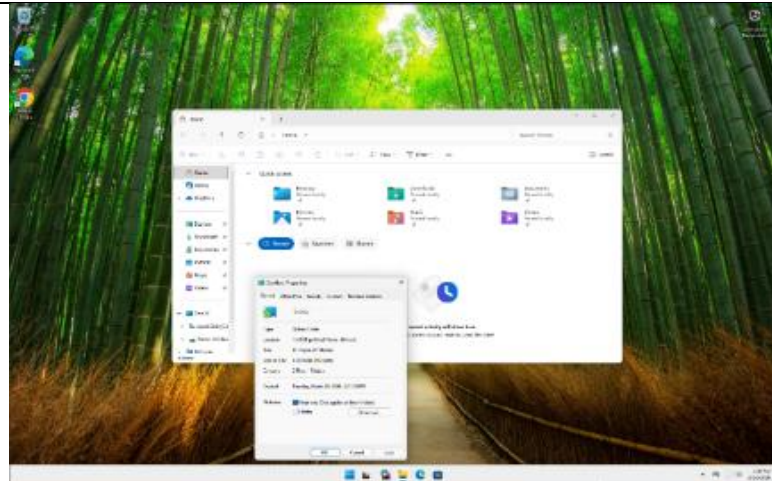

- Sign into the machine as administrator.

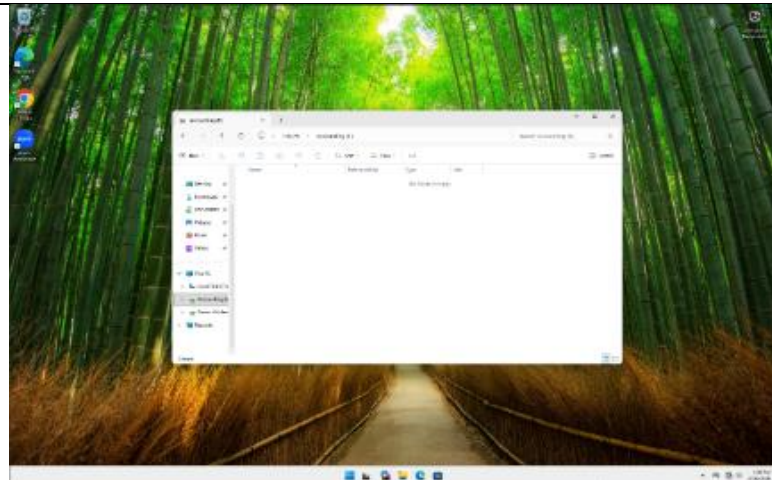

- You will see the appropriate software downloaded, searchbar gone, new wallpaper, and further policies that we added are now in effect.

- Do the same for the workstation, run `gpupdate /force` and restart the machine to see the policies take effect. You will also see that the Desktop and Documents folder are redirected to the appropriate place.

- If you sign in as a regular user you will see the respective drive mapped.

- The wallpaper might take a second to switch the new one.
